Mentors:

Andrew Hundt

Dr. Peter Kazanzides

Project Summary

- Integrate torque sensor data from Robone femur cutting robot
 - Force controlled velocity (FCV) algorithm to change the cutting speed of the robot in response to the force on the cutting tool
 - *Null space compliance* to allow robot joints to be manipulated without altering cut path

physically

Deliverables

Minimum

- Implement an algorithm to traverse cutting path at varying speeds ✓
- Position control force controlled velocity implementation in software ✓
- Demonstrate position controlled velocity on hardware (robot) ✓

Expected

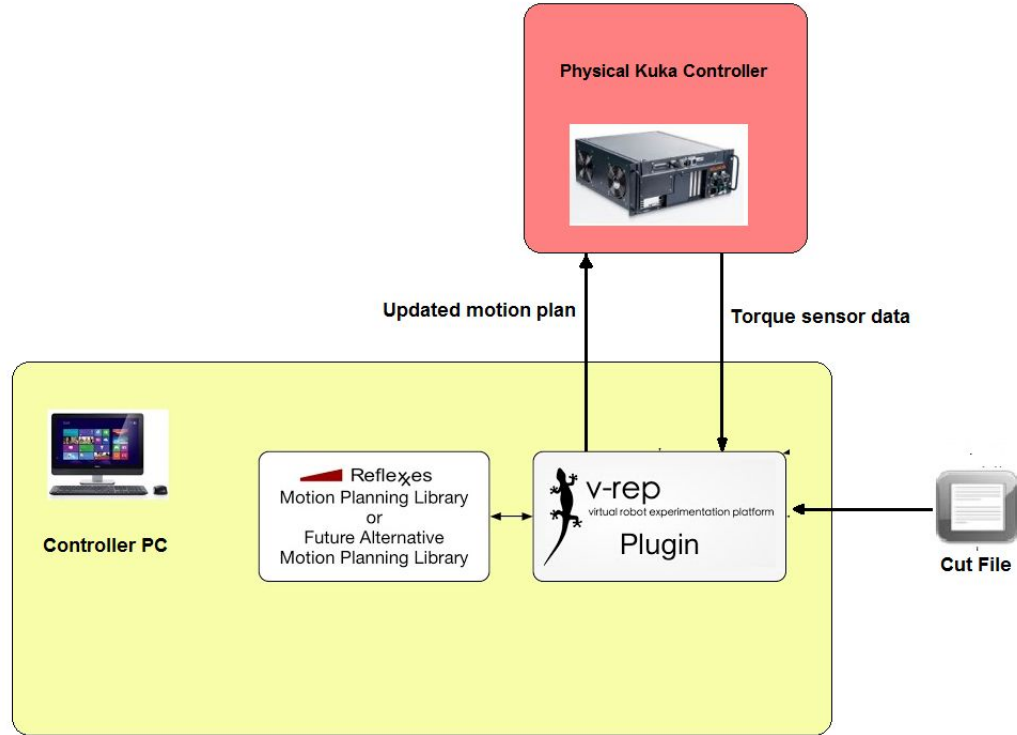

- Factor in end effector mass into calculations ◀
- Test force control based on known resistance ◀

Maximum

- Demonstrate torque control in software
- Demonstrate torque control on hardware
- Human force null space compliance (fixed and cut path)
- Quantify accuracy of robot arm torque sensors

System Overview

Passing Data

- Created duplicate arm to reflect measured data in V-REP
- Pass data from KUKA controller to V-REP plug-in
- Convert external torque data to bytes and pass to V-REP duplicate arm
- Convert byte data back to numbers to calculate tool-tip force

Tool-Tip Force

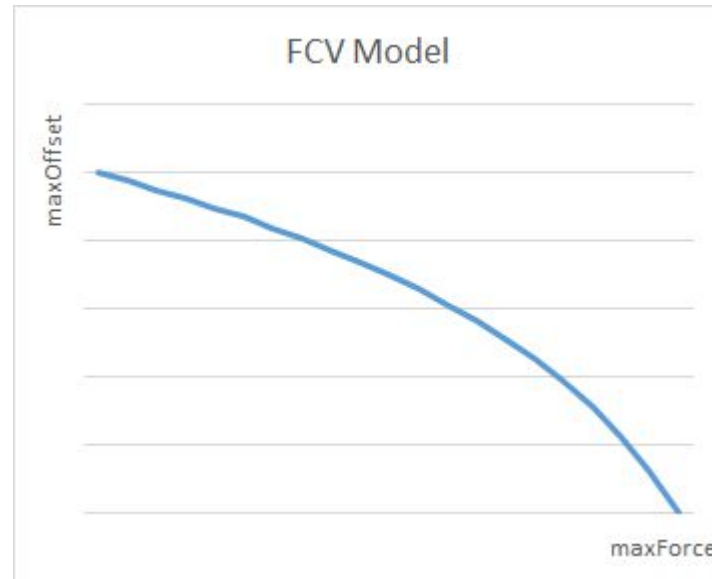

Variable Velocity Algorithm

- Old constant velocity implementation
 - Two representation of path position:
 - Absolute path position (measured in meters)
 - Relative path position (mapped from 0 to 1)
1. Offset determined by FCV Model
 2. Add absolute path position to offset
 3. Convert new absolute path position to (x, y, z) coordinates
 4. Set robot position to coordinates

FCV Model

- Goal: more sensitivity at higher forces to dampen effect of noise
- General shape: concave down with axes intersections at maxForce and maxOffset
- Possible models
 - Natural log
 - Square root

Constant Velocity

Variable Velocity

Dependencies

- Access to lab
- Access to robot arm & mentors
- Access to Robone Git repository
- Access to Linux machine to drive robot
- API access to force data
- Funding for experiment

Planned Timeline (02/18/2016)
