Composition

Assume $\mathbf{F}_1 = [\mathbf{R}_1, \vec{\mathbf{p}}_1]$, $\mathbf{F}_2 = [\mathbf{R}_2, \vec{\mathbf{p}}_2]$

Then

$$\begin{aligned}
 \mathbf{F}_1 \bullet \mathbf{F}_2 \bullet \vec{\mathbf{b}} &= \mathbf{F}_1 \bullet (\mathbf{F}_2 \bullet \vec{\mathbf{b}}) \\
 &= \mathbf{F}_1 \bullet (\mathbf{R}_2 \bullet \vec{\mathbf{b}} + \vec{\mathbf{p}}_2) \\
 &= [\mathbf{R}_1, \vec{\mathbf{p}}_1] \bullet (\mathbf{R}_2 \bullet \vec{\mathbf{b}} + \vec{\mathbf{p}}_2) \\
 &= \mathbf{R}_1 \bullet (\mathbf{R}_2 \bullet \vec{\mathbf{b}} + \vec{\mathbf{p}}_2) + \vec{\mathbf{p}}_1 \\
 &= \mathbf{R}_1 \bullet \mathbf{R}_2 \bullet \vec{\mathbf{b}} + \mathbf{R}_1 \bullet \vec{\mathbf{p}}_2 + \vec{\mathbf{p}}_1 \\
 &= [\mathbf{R}_1 \bullet \mathbf{R}_2, \mathbf{R}_1 \bullet \vec{\mathbf{p}}_2 + \vec{\mathbf{p}}_1] \bullet \vec{\mathbf{b}}
 \end{aligned}$$

So

$$\begin{aligned}
 \mathbf{F}_1 \bullet \mathbf{F}_2 &= [\mathbf{R}_1, \vec{\mathbf{p}}_1] \bullet [\mathbf{R}_2, \vec{\mathbf{p}}_2] \\
 &= [\mathbf{R}_1 \bullet \mathbf{R}_2, \mathbf{R}_1 \vec{\mathbf{p}}_2 + \vec{\mathbf{p}}_1]
 \end{aligned}$$

Vectors

$$\vec{\mathbf{v}}_{col} = \begin{bmatrix} v_x \\ v_y \\ v_z \end{bmatrix}$$

$$\vec{\mathbf{v}}_{row} = \begin{bmatrix} v_x & v_y & v_z \end{bmatrix}$$

$$\text{length: } \|\vec{\mathbf{v}}\| = \sqrt{v_x^2 + v_y^2 + v_z^2}$$

$$\text{dot product: } a = \vec{\mathbf{v}} \cdot \vec{\mathbf{w}} = (v_x w_x + v_y w_y + v_z w_z) = \|\vec{\mathbf{v}}\| \|\vec{\mathbf{w}}\| \cos \theta$$

$$\text{cross product: } \vec{\mathbf{u}} = \vec{\mathbf{v}} \times \vec{\mathbf{w}} = \begin{bmatrix} v_y w_z - v_z w_y \\ v_z w_x - v_x w_z \\ v_x w_y - v_y w_x \end{bmatrix}, \|\vec{\mathbf{u}}\| = \|\vec{\mathbf{v}}\| \|\vec{\mathbf{w}}\| \sin \theta$$

Russell H. Taylor Copyright 1996-2022; 600.455/655 lecture notes

JHU Laboratory for Computational Sensing and Robotics

23

Matrix representation of cross product operator

Define

$$\hat{\vec{a}} \stackrel{\Delta}{=} skew(\vec{a}) \stackrel{\Delta}{=} \begin{bmatrix} 0 & -a_z & a_y \\ a_z & 0 & -a_x \\ -a_y & a_x & 0 \end{bmatrix}$$

Then

$$\vec{a} \times \vec{v} = skew(\vec{a}) \bullet \vec{v}$$

Rotations: Some Notation

$Rot(\vec{a}, \alpha)$ = Rotation by angle α about axis \vec{a}

$\mathbf{R}_{\vec{a}}(\alpha)$ = Rotation by angle α about axis \vec{a}

$$\mathbf{R}(\vec{a}) = Rot(\vec{a}, \|\vec{a}\|)$$

$$\mathbf{R}_{xyz}(\alpha, \beta, \gamma) = \mathbf{R}(\vec{x}, \alpha) \bullet \mathbf{R}(\vec{y}, \beta) \bullet \mathbf{R}(\vec{z}, \gamma)$$

$$\mathbf{R}_{zyx}(\alpha, \beta, \gamma) = \mathbf{R}(\vec{z}, \alpha) \bullet \mathbf{R}(\vec{y}, \beta) \bullet \mathbf{R}(\vec{x}, \gamma)$$

Rotations: A few useful facts

$$Rot(s\vec{a}, \alpha) \bullet \vec{a} = \vec{a} \quad \text{and} \quad \|Rot(\vec{a}, \alpha) \bullet \vec{b}\| = \|\vec{b}\|$$

$$Rot(\vec{a}, \alpha) = Rot(\hat{a}, \alpha) \quad \text{where } \hat{a} = \frac{\vec{a}}{\|\vec{a}\|}$$

NOTE: Unless otherwise stated, we will usually assume that \vec{a} in $Rot(\vec{a}, \theta)$ is a unit vector. I.e., $\|\vec{a}\|=1$.

$$Rot(\vec{a}, \alpha) \bullet Rot(\vec{a}, \beta) = Rot(\vec{a}, \alpha + \beta)$$

$$Rot(\vec{a}, \alpha)^{-1} = Rot(\vec{a}, -\alpha)$$

$$Rot(\vec{a}, 0) \bullet \vec{b} = \vec{b} \quad \text{i.e., } Rot(\vec{a}, 0) = \mathbf{I}_{Rot} = \text{the identity rotation}$$

$$Rot(\hat{a}, \alpha) \bullet \vec{b} = (\hat{a} \bullet \vec{b}) \hat{a} + Rot(\hat{a}, \alpha) \bullet (\vec{b} - (\hat{a} \bullet \vec{b}) \hat{a})$$

$$Rot(\hat{a}, \alpha) \bullet Rot(\hat{b}, \beta) = Rot(\hat{b}, \beta) \bullet Rot(Rot(\hat{b}, -\beta) \bullet \hat{a}, \alpha)$$

$$Rot(\hat{a}, \alpha) \bullet \mathbf{R}_\beta = \mathbf{R}_\beta \bullet Rot(\mathbf{R}_\beta^{-1} \bullet \hat{a}, \alpha)$$

$$\mathbf{R}_\alpha \bullet Rot(\hat{b}, \beta) = Rot(\mathbf{R}_\alpha \bullet \hat{b}, \beta) \bullet \mathbf{R}_\alpha$$

JHU Laboratory for Computational Sensing and Robotics

Rotations: more facts

If $\vec{v} = [v_x, v_y, v_z]^T$ then a rotation $\mathbf{R} \bullet \vec{v}$ may be described in

terms of the effects of \mathbf{R} on orthogonal unit vectors, $\vec{e}_x = [1, 0, 0]^T$,

$$\vec{e}_y = [0, 1, 0]^T, \vec{e}_z = [0, 0, 1]^T$$

$$\mathbf{R} \bullet \vec{v} = v_x \vec{r}_x + v_y \vec{r}_y + v_z \vec{r}_z$$

where

$$\vec{r}_x = \mathbf{R} \bullet \vec{e}_x$$

$$\vec{r}_y = \mathbf{R} \bullet \vec{e}_y$$

$$\vec{r}_z = \mathbf{R} \bullet \vec{e}_z$$

Note that rotation doesn't affect inner products

$$(\mathbf{R} \bullet \vec{b}) \bullet (\mathbf{R} \bullet \vec{c}) = \vec{b} \bullet \vec{c}$$

or lengths of vectors

$$\|\mathbf{R} \bullet \vec{v}\| = \|\vec{v}\|$$

JHU Laboratory for Computational Sensing and Robotics

32

Properties of Rotation Matrices

Inverse of a Rotation Matrix equals its transpose:

$$\mathbf{R}^{-1} = \mathbf{R}^T$$

$$\mathbf{R}^T \mathbf{R} = \mathbf{R} \mathbf{R}^T = \mathbf{I}$$

The Determinant of a Rotation matrix is equal to +1:

$$\det(\mathbf{R}) = +1$$

Any Rotation can be described by consecutive rotations about the three primary axes, x, y, and z:

$$\mathbf{R} = \mathbf{R}_{z,\theta} \mathbf{R}_{y,\phi} \mathbf{R}_{x,\psi}$$

Axis-angle Representations of Rotations

Rodrigues' Formula (1840)*

Rotation of a vector \vec{b} by angle α about axis \vec{a}

(Assumes that \vec{a} is a unit vector, $\|\vec{a}\| = 1$)

* Olinde Rodrigues, "Des lois géométriques qui régissent les déplacements d'un système solide dans l'espace, et de la variation des coordonnées provenant de ces déplacements considérés indépendants des causes qui peuvent les produire", *Journal de Mathématiques Pures et Appliquées* 5 (1840), 380–440. (http://sites.mathdoc.fr/JMPA/PDF/JMPA_1840_1_5_A39_0.pdf)

Russell H. Taylor Copyright 1996-2022; 600.455/655 lecture notes

JHU Laboratory for Computational Sensing and Robotics

35

Exponential representation

Consider a rotation about axis \vec{n} by angle θ . Then

$$e^{skew(\vec{n})\theta} = \mathbf{I} + \theta skew(\vec{n}) + \frac{\theta^2}{2!} skew(\vec{n})^2 + \dots$$

By doing some manipulation, you can show

$$\begin{aligned} Rot(\vec{n}, \theta) &= e^{skew(\vec{n})\theta} \\ &= \mathbf{I} + skew(\vec{n})\sin\theta + skew(\vec{n})^2(1 - \cos\theta) \\ &= \mathbf{I} + skew(\vec{n})\sin\theta + (\vec{n} \bullet \vec{n}^T - \mathbf{I})(1 - \cos\theta) \\ &= \mathbf{I}\cos\theta + skew(\vec{n})\sin\theta + \vec{n} \bullet \vec{n}^T(1 - \cos\theta) \end{aligned}$$

which is just Rodrigues' formula.

Note that for small θ , this reduces to

$$Rot(\vec{n}, \theta) \approx \mathbf{I} + skew(\theta\vec{n})$$

Cayley Transform Representation

Consider the rotation $Rot(\vec{n}, \theta)$ and define

$$\vec{a} = \left(\tan \frac{\theta}{2} \right) \vec{n}$$

$$\mathbf{A} = skew(\vec{a})$$

Then,

$$\mathbf{R} = (\mathbf{I} - \mathbf{A})^{-1}(\mathbf{I} + \mathbf{A}) = (\mathbf{I} + \mathbf{A})(\mathbf{I} - \mathbf{A})^{-1}$$

gives the rotation matrix corresponding to $Rot(\vec{n}, \theta)$. Similarly, given \mathbf{R} ,

$$\mathbf{A} = (\mathbf{R} - \mathbf{I})(\mathbf{I} + \mathbf{R})^{-1}$$

gives the elements of $skew(\vec{a})$ and hence for \vec{a} .

Note : The above relations require that $\theta \neq \pm\pi$.

Homogeneous Coordinates

- Widely used in graphics, geometric calculations
- Represent 3D vector as 4D quantity
- For our current purposes, we will keep the “scale” $s = 1$

$$\vec{v} \equiv \begin{bmatrix} xs \\ ys \\ zs \\ s \end{bmatrix} \cong \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

Russell H. Taylor Copyright 1996-2022; 600.455/655 lecture notes

JHU Laboratory for Computational Sensing and Robotics

39

Representing Frame Transformations as Matrices

$$v + p \rightarrow \begin{bmatrix} 1 & 0 & 0 & p_x \\ 0 & 1 & 0 & p_y \\ 0 & 0 & 1 & p_z \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} v_x \\ v_y \\ v_z \\ 1 \end{bmatrix} = [I, \bar{p}] \bullet v$$

$$R \bullet v \rightarrow \begin{bmatrix} R & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} v \\ 1 \end{bmatrix}$$

$$P \bullet R \rightarrow \begin{bmatrix} I & p \\ 0 & 1 \end{bmatrix} \bullet \begin{bmatrix} R & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} R & p \\ 0 & 1 \end{bmatrix} = [R, p] = F$$

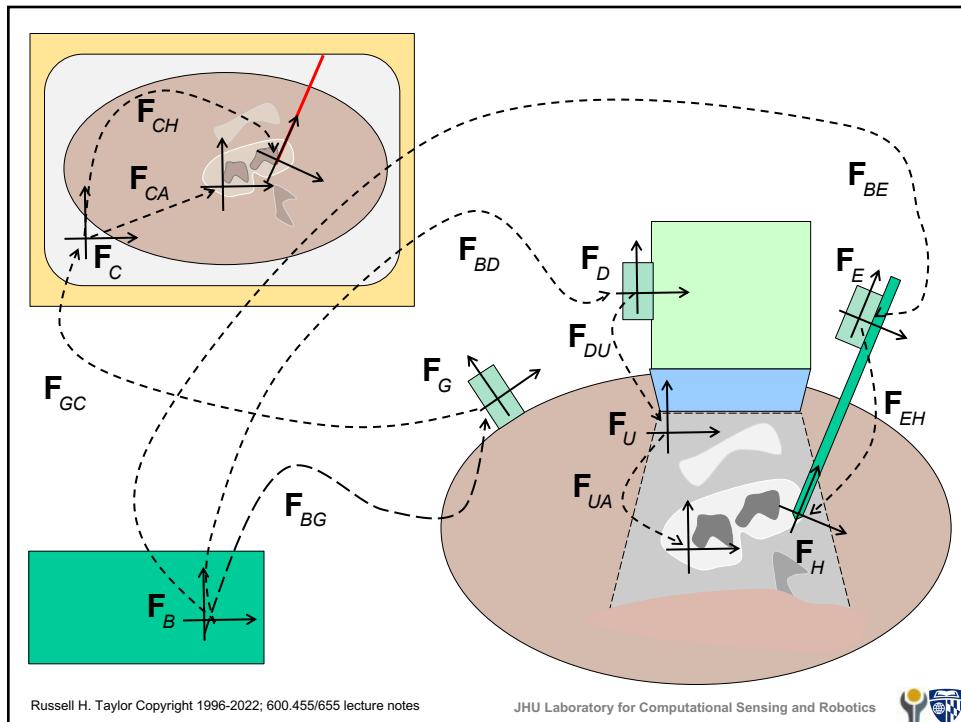

$$F \bullet v \rightarrow \begin{bmatrix} R & p \\ 0 & 1 \end{bmatrix} \begin{bmatrix} v \\ 1 \end{bmatrix} = \begin{bmatrix} (R \bullet v) + p \\ 1 \end{bmatrix}$$

Frame transformation from 3 point pairs

$$\vec{\mathbf{v}}_k = \mathbf{F}_{rc} \vec{\mathbf{b}}_k = \mathbf{R}_{rc} \vec{\mathbf{b}}_k + \vec{\mathbf{p}}_{rc}$$

Define

$$\vec{\mathbf{v}}_m = \frac{1}{3} \sum_1^3 \vec{\mathbf{v}}_k \quad \vec{\mathbf{b}}_m = \frac{1}{3} \sum_1^3 \vec{\mathbf{b}}_k$$

$$\vec{\mathbf{u}}_k = \vec{\mathbf{v}}_k - \vec{\mathbf{v}}_m \quad \vec{\mathbf{a}}_k = \vec{\mathbf{b}}_k - \vec{\mathbf{b}}_m$$

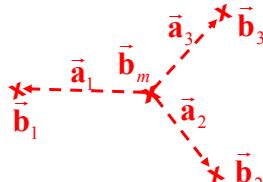

$$\mathbf{F}_{rc} \vec{\mathbf{a}}_k = \mathbf{R}_{rc} \vec{\mathbf{a}}_k + \vec{\mathbf{p}}_{rc}$$

$$\mathbf{R}_{rc} \vec{\mathbf{a}}_k + \vec{\mathbf{p}}_{rc} = \mathbf{R}_{rc} (\vec{\mathbf{b}}_k - \vec{\mathbf{b}}_m) + \vec{\mathbf{p}}_{rc}$$

$$\mathbf{R}_{rc} \vec{\mathbf{a}}_k = \mathbf{R}_{rc} \vec{\mathbf{b}}_k + \vec{\mathbf{p}}_{rc} - \mathbf{R}_{rc} \vec{\mathbf{b}}_m - \vec{\mathbf{p}}_{rc}$$

$$\boxed{\begin{aligned} \mathbf{R}_{rc} \vec{\mathbf{a}}_k &= \vec{\mathbf{v}}_k - \vec{\mathbf{v}}_m = \vec{\mathbf{u}}_k \\ \vec{\mathbf{p}}_{rc} &= \vec{\mathbf{v}}_m - \mathbf{R}_{rc} \vec{\mathbf{b}}_m \end{aligned}}$$

Solve These!!

Russell H. Taylor Copyright 1996-2022; 600.455/655 lecture notes

JHU Laboratory for Computational Sensing and Robotics

52

23

Rotation from multiple vector pairs

Given a system $\mathbf{R}\vec{\mathbf{a}}_k = \vec{\mathbf{u}}_k$ for $k = 1, \dots, n$ the problem is to estimate \mathbf{R} . This will require at least three such point pairs. Later in the course we will cover some good ways to solve this system. Here is a not-so-good way that will produce roughly correct answers:

Step 1: Form matrices $\mathbf{U} = [\vec{\mathbf{u}}_1 \ \dots \ \vec{\mathbf{u}}_n]$ and $\mathbf{A} = [\vec{\mathbf{a}}_1 \ \dots \ \vec{\mathbf{a}}_n]$

Step 2: Solve the system $\mathbf{RA} = \mathbf{U}$ for \mathbf{R} . E.g., by $\mathbf{R} = \mathbf{UA}^{-1}$

Step 3: Renormalize \mathbf{R} to guarantee $\mathbf{R}^T \mathbf{R} = \mathbf{I}$.

Renormalizing Rotation Matrix

Given "rotation" matrix $\mathbf{R} = [\vec{\mathbf{r}}_x \ | \ \vec{\mathbf{r}}_y \ | \ \vec{\mathbf{r}}_z]$, modify it so $\mathbf{R}^T \mathbf{R} = \mathbf{I}$.

Step 1: $\vec{\mathbf{a}} = \vec{\mathbf{r}}_y \times \vec{\mathbf{r}}_z$

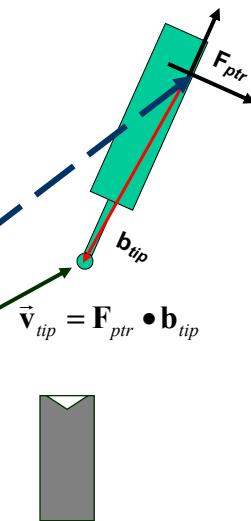

Step 2: $\vec{\mathbf{b}} = \vec{\mathbf{r}}_z \times \vec{\mathbf{a}}$

Step 3: $\mathbf{R}_{normalized} = \left[\frac{\vec{\mathbf{a}}}{\|\vec{\mathbf{a}}\|} \ | \ \frac{\vec{\mathbf{b}}}{\|\vec{\mathbf{b}}\|} \ | \ \frac{\vec{\mathbf{r}}_z}{\|\vec{\mathbf{r}}_z\|} \right]$

Calibrating a pointer

But what is \mathbf{b}_{tip} ??

Russell H. Taylor Copyright 1996-2022; 600.455/655 lecture notes

JHU Laboratory for Computational Sensing and Robotics

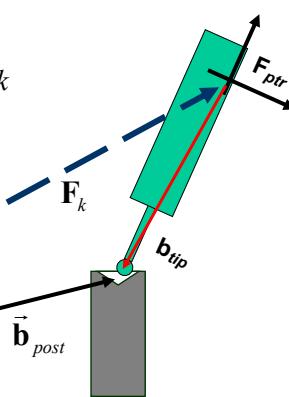

55

Calibrating a pointer

$$\vec{\mathbf{b}}_{post} = \mathbf{F}_k \vec{\mathbf{b}}_{tip}$$

$$= \mathbf{R}_k \vec{\mathbf{b}}_{tip} + \vec{\mathbf{p}}_k$$

Russell H. Taylor Copyright 1996-2022; 600.455/655 lecture notes

JHU Laboratory for Computational Sensing and Robotics

56

25

Calibrating a pointer

For each measurement k , we have

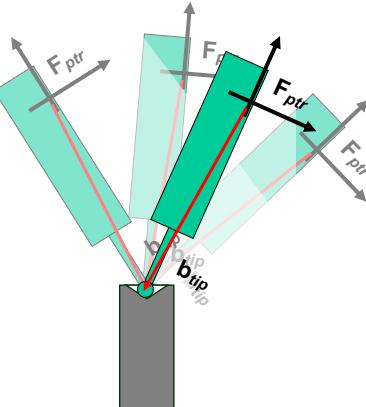

$$\vec{b}_{post} = \mathbf{R}_k \vec{b}_{tip} + \vec{p}_k$$

i. e.,

$$\mathbf{R}_k \vec{b}_{tip} - \vec{b}_{post} = -\vec{p}_k$$

Set up a least squares problem

$$\begin{bmatrix} \vdots & | & \vdots \\ \mathbf{R}_k & | & -\mathbf{I} \\ \vdots & | & \vdots \end{bmatrix} \begin{bmatrix} \vec{b}_{tip} \\ \vec{b}_{post} \end{bmatrix} \cong \begin{bmatrix} \vdots \\ -\vec{p}_k \\ \vdots \end{bmatrix}$$

“Small” Transformations

- A great deal of CIS is concerned with computing and using geometric information based on imprecise knowledge
- Similarly, one is often concerned with the effects of relatively small rotations and displacements
- Essentially, we will be using fairly straightforward linearizations to model these situations, but a specialized notation is often useful

Russell H. Taylor Copyright 1996-2022; 600.455/655 lecture notes

JHU Laboratory for Computational Sensing and Robotics

66

“Small” Frame Transformations

Represent a "small" pose shift consisting of a small rotation $\Delta\mathbf{R}$ followed by a small displacement $\Delta\vec{\mathbf{p}}$ as

$$\Delta\mathbf{F} = [\Delta\mathbf{R}, \Delta\vec{\mathbf{p}}]$$

Then

$$\Delta\mathbf{F} \bullet \vec{\mathbf{v}} = \Delta\mathbf{R} \bullet \vec{\mathbf{v}} + \Delta\vec{\mathbf{p}}$$

Russell H. Taylor Copyright 1996-2022; 600.455/655 lecture notes

JHU Laboratory for Computational Sensing and Robotics

67

Small Rotations

$\Delta\mathbf{R}$ = a small rotation

$\mathbf{R}_{\vec{\mathbf{a}}}(\Delta\alpha)$ = a rotation by a small angle $\Delta\alpha$ about axis $\vec{\mathbf{a}}$

$Rot(\vec{\mathbf{a}}, \|\vec{\mathbf{a}}\|) \bullet \vec{\mathbf{b}} \approx \vec{\mathbf{a}} \times \vec{\mathbf{b}} + \vec{\mathbf{b}}$ for $\|\vec{\mathbf{a}}\|$ sufficiently small

$\Delta\mathbf{R}(\vec{\mathbf{a}})$ = a rotation that is small enough so that any error introduced by this approximation is negligible

$$\Delta\mathbf{R}(\lambda \vec{\mathbf{a}}) \bullet \Delta\mathbf{R}(\mu \vec{\mathbf{b}}) \approx \Delta\mathbf{R}(\lambda \vec{\mathbf{a}} + \mu \vec{\mathbf{b}}) \quad (\text{Linearity for small rotations})$$

Exercise: Work out the linearity proposition by substitution

Approximations to “Small” Frames

$$\Delta\mathbf{F}(\vec{\mathbf{a}}, \Delta\vec{\mathbf{p}}) \triangleq [\Delta\mathbf{R}(\vec{\mathbf{a}}), \Delta\vec{\mathbf{p}}]$$

$$\begin{aligned} \Delta\mathbf{F}(\vec{\mathbf{a}}, \Delta\vec{\mathbf{p}}) \bullet \vec{\mathbf{v}} &= \Delta\mathbf{R}(\vec{\mathbf{a}}) \bullet \vec{\mathbf{v}} + \Delta\vec{\mathbf{p}} \\ &\approx \vec{\mathbf{v}} + \vec{\mathbf{a}} \times \vec{\mathbf{v}} + \Delta\vec{\mathbf{p}} \end{aligned}$$

$$\begin{aligned} \vec{\mathbf{a}} \times \vec{\mathbf{v}} &= skew(\vec{\mathbf{a}}) \bullet \vec{\mathbf{v}} \\ &= \begin{bmatrix} 0 & -a_z & a_y \\ a_z & 0 & -a_x \\ -a_y & a_x & 0 \end{bmatrix} \bullet \begin{bmatrix} v_x \\ v_y \\ v_z \end{bmatrix} \\ skew(\vec{\mathbf{a}}) \bullet \vec{\mathbf{a}} &= \vec{\mathbf{a}} \times \vec{\mathbf{a}} = \vec{0} \end{aligned}$$

$$\Delta\mathbf{R}(\vec{\mathbf{a}}) \approx \mathbf{I} + skew(\vec{\mathbf{a}})$$

$$\Delta\mathbf{R}(\vec{\mathbf{a}})^{-1} \approx \mathbf{I} - skew(\vec{\mathbf{a}}) = \mathbf{I} + skew(-\vec{\mathbf{a}})$$

Approximations to “Small” Frames

Notational NOTE:

We often use $\vec{\alpha}$ to represent a vector of small angles
and $\vec{\varepsilon}$ to represent a vector of small displacements

In using these approximations, we typically ignore second order terms. I.e.,

$$\vec{\alpha}_A \vec{\alpha}_B \approx \vec{0}, \vec{\alpha}_A \vec{\varepsilon}_B \approx \vec{0}, \vec{\varepsilon}_A \vec{\varepsilon}_B \approx \vec{0}, \text{etc.}$$

Russell H. Taylor Copyright 1996-2022; 600.455/655 lecture notes

JHU Laboratory for Computational Sensing and Robotics

70

Errors & sensitivity

Often, we do not have an accurate value for a transformation,
so we need to model the error. We model this as a composition
of a "nominal" frame and a small displacement

$$\mathbf{F}_{\text{actual}} = \mathbf{F}_{\text{nominal}} \bullet \Delta \mathbf{F}$$

Often, we will use the notation \mathbf{F}^* for $\mathbf{F}_{\text{actual}}$ and will just use
 \mathbf{F} for $\mathbf{F}_{\text{nominal}}$. Thus we may write something like

$$\mathbf{F}^* = \mathbf{F} \bullet \Delta \mathbf{F}$$

or (less often) $\mathbf{F}^* = \Delta \mathbf{F} \bullet \mathbf{F}$. We also use $\vec{v}^* = \vec{v} + \Delta \vec{v}$, etc.
Thus, if we use the former form (error on the right), and
have nominal relationship $\vec{v} = \mathbf{F} \bullet \vec{b}$, we get

$$\begin{aligned}\vec{v}^* &= \mathbf{F}^* \bullet \vec{b}^* \\ &= \mathbf{F} \bullet \Delta \mathbf{F} \bullet (\vec{b} + \Delta \vec{b}) = \mathbf{F} \bullet (\Delta \mathbf{R} \bullet \vec{b} + \Delta \mathbf{R} \bullet \Delta \vec{b} + \Delta \vec{p}) \\ &\approx \mathbf{R} \bullet ((I + sk(\vec{\alpha})) \bullet (\vec{b} + \Delta \vec{b}) + \Delta \vec{p}) + \vec{p} = \mathbf{R} \bullet (\vec{b} + \vec{\alpha} \times \vec{b} + \Delta \vec{b} + \Delta \vec{p}) + \vec{p} \\ &\approx \mathbf{R} \bullet (\vec{\alpha} \times \vec{b} + \Delta \vec{b} + \Delta \vec{p}) + \mathbf{R} \bullet \vec{b} + \vec{p} = \mathbf{R} \bullet (\vec{\alpha} \times \vec{b} + \Delta \vec{b} + \Delta \vec{p}) + \vec{v} \\ \Delta \vec{v} &\approx \mathbf{R} \bullet (\vec{\alpha} \times \vec{b} + \Delta \vec{b} + \Delta \vec{p})\end{aligned}$$

71

32

“Small Errors”

Suppose that there is a small systematic error in the tracking system so that

$$\mathbf{F}_{Bx}^* = \Delta\mathbf{F}_B \mathbf{F}_{Bx}$$

for $\mathbf{F}_{BG}, \mathbf{F}_{BD}, \mathbf{F}_{BE}$. How does this affect the calculation of \mathbf{F}_{GH} ?

$$\begin{aligned}\mathbf{F}_{GH}^* &= (\mathbf{F}_{BG}^*)^{-1} \mathbf{F}_{BE}^* \mathbf{F}_{EH} \\ \mathbf{F}_{GH} \Delta\mathbf{F}_{GH} &= (\Delta\mathbf{F}_B \mathbf{F}_{BG})^{-1} \Delta\mathbf{F}_B \mathbf{F}_{BE} \mathbf{F}_{EH} \\ \Delta\mathbf{F}_{GH} &= \mathbf{F}_{GH}^{-1} (\Delta\mathbf{F}_B \mathbf{F}_{BG})^{-1} \Delta\mathbf{F}_B \mathbf{F}_{BE} \mathbf{F}_{EH} \\ &= \mathbf{F}_{GH}^{-1} \mathbf{F}_{BG}^{-1} \Delta\mathbf{F}_B^{-1} \Delta\mathbf{F}_B \mathbf{F}_{BE} \mathbf{F}_{EH} \\ &= \mathbf{F}_{GH}^{-1} \mathbf{F}_{BG}^{-1} \mathbf{F}_{BE} \mathbf{F}_{EH} = \mathbf{F}_{GH}^{-1} \mathbf{F}_{GH} = \mathbf{I}\end{aligned}$$

Russell H. Taylor Copyright 1996-2022; 600.455/655 lecture notes JHU Laboratory for Computational Sensing and Robotics

72

“Small Errors”

Suppose that there are additional errors in the tracking of each tracker body so that

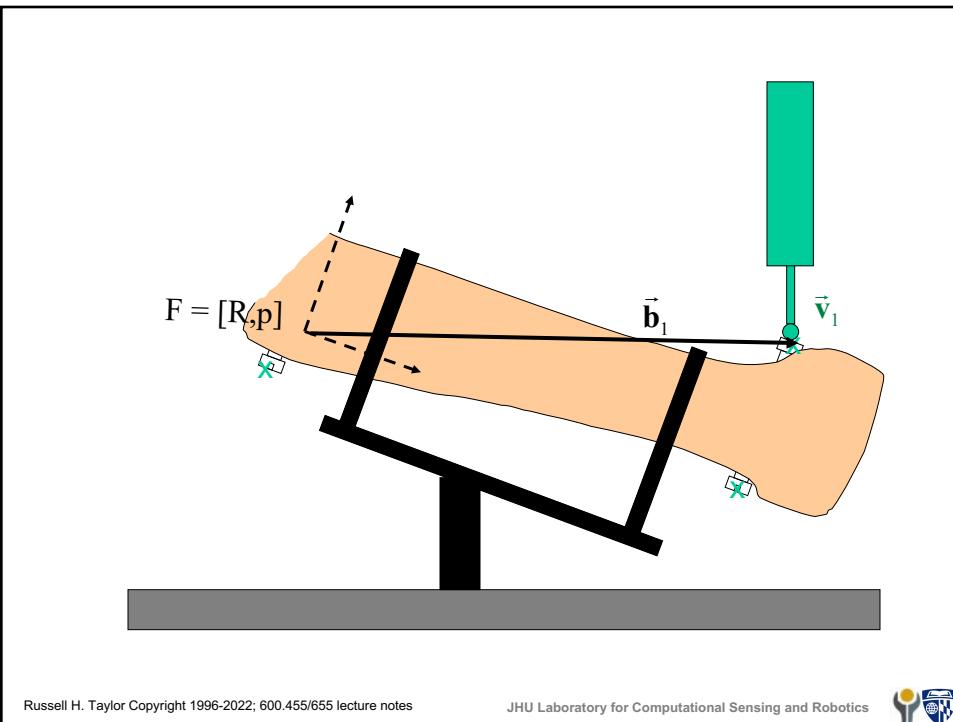

$$\mathbf{F}_{Bx}^* = \Delta\mathbf{F}_B \mathbf{F}_{Bx} \Delta\mathbf{F}_{Bx}$$

for $\mathbf{F}_{BG}, \mathbf{F}_{BD}, \mathbf{F}_{BE}$. How does this affect the calculation of \mathbf{F}_{GH} ?

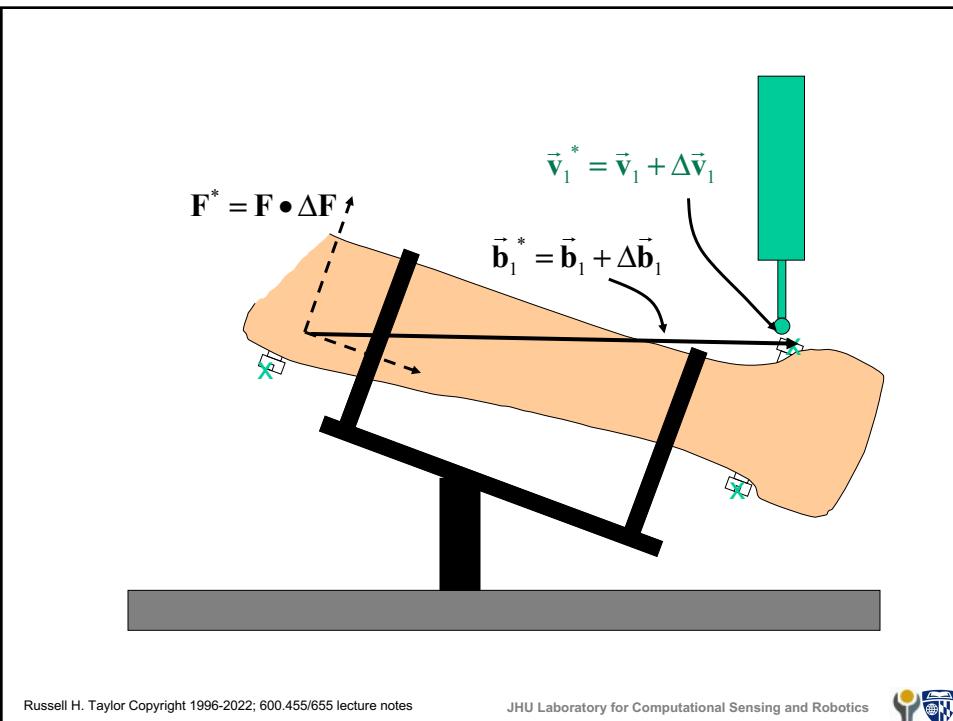

$$\begin{aligned}\mathbf{F}_{GH}^* &= \mathbf{F}_{GH} \Delta\mathbf{F}_{GH} = (\mathbf{F}_{BG}^*)^{-1} \mathbf{F}_{BE}^* \mathbf{F}_{EH} \\ \Delta\mathbf{F}_{GH} &= \mathbf{F}_{GH}^{-1} (\Delta\mathbf{F}_B \mathbf{F}_{BG} \Delta\mathbf{F}_{Bx})^{-1} (\Delta\mathbf{F}_B \mathbf{F}_{BE} \Delta\mathbf{F}_{Bx}) \mathbf{F}_{EH} \\ \Delta\mathbf{F}_{GH} &= (\mathbf{F}_{BG}^{-1} \mathbf{F}_{BE} \mathbf{F}_{EH})^{-1} \Delta\mathbf{F}_{BG}^{-1} \mathbf{F}_{BG}^{-1} \Delta\mathbf{F}_B^{-1} \Delta\mathbf{F}_B \mathbf{F}_{BE} \Delta\mathbf{F}_{Bx} \mathbf{F}_{EH} \\ &= \mathbf{F}_{EH}^{-1} \mathbf{F}_{BE}^{-1} \mathbf{F}_{BG}^{-1} \Delta\mathbf{F}_B^{-1} \mathbf{F}_{BG}^{-1} \Delta\mathbf{F}_B \mathbf{F}_{BE} \Delta\mathbf{F}_{Bx} \mathbf{F}_{EH}\end{aligned}$$

76

Errors & Sensitivity

Suppose that we know nominal values for \mathbf{F} , $\vec{\mathbf{b}}$, and $\vec{\mathbf{v}}$ and that

$$[-\varepsilon, -\varepsilon, -\varepsilon]^T \leq \Delta\vec{\mathbf{v}}_1 \leq [\varepsilon, \varepsilon, \varepsilon]^T \quad (\text{i.e., } \|\Delta\vec{\mathbf{v}}_1\|_\infty \leq \varepsilon)$$

What does this tell us about $\Delta\mathbf{F} = [\Delta\mathbf{R}, \Delta\vec{\mathbf{p}}]$?

Russell H. Taylor Copyright 1996-2022; 600.455/655 lecture notes

JHU Laboratory for Computational Sensing and Robotics

77

Errors & Sensitivity

$$\begin{aligned}
 \vec{v}^* &= F^* \bullet \vec{b}^* \\
 &= F \bullet \Delta F \bullet (\vec{b} + \Delta \vec{b}) \\
 &= R \bullet (\Delta R(\vec{\alpha}) \bullet (\vec{b} + \Delta \vec{b}) + \Delta \vec{p}) + \vec{p} \\
 &\approx R \bullet (\vec{b} + \Delta \vec{b} + \vec{\alpha} \times \vec{b} + \vec{\alpha} \times \Delta \vec{b} + \Delta \vec{p}) + \vec{p} \\
 &= R \bullet \vec{b} + \vec{p} + R \bullet (\Delta \vec{b} + \vec{\alpha} \times \vec{b} + \vec{\alpha} \times \Delta \vec{b} + \Delta \vec{p}) \\
 &\approx \vec{v} + R \bullet (\Delta \vec{b} + \vec{\alpha} \times \vec{b} + \Delta \vec{p})
 \end{aligned}$$

if $\|\vec{\alpha} \times \Delta \vec{b}\| \leq \|\vec{\alpha}\| \|\Delta \vec{b}\|$ is negligible (it usually is)

so

$$\Delta \vec{v} = \vec{v}^* - \vec{v} \approx R \bullet (\Delta \vec{b} + \vec{\alpha} \times \vec{b} + \Delta \vec{p}) = R \bullet \Delta \vec{b} + R \bullet \vec{\alpha} \times \vec{b} + R \bullet \Delta \vec{p}$$

Russell H. Taylor Copyright 1996-2022; 600.455/655 lecture notes

JHU Laboratory for Computational Sensing and Robotics

78

Digression: “rotation triple product”

Expressions like $R \bullet \vec{a} \times \vec{b}$ are linear in \vec{a} , but are not always convenient to work with. Often we would prefer something like $M(R, \vec{b}) \bullet \vec{a}$.

$$\begin{aligned}
 R \bullet \vec{a} \times \vec{b} &= -R \bullet \vec{b} \times \vec{a} \\
 &= R \bullet skew(-\vec{b}) \bullet \vec{a} \\
 &= [R \bullet skew(\vec{b})^T] \bullet \vec{a}
 \end{aligned}$$

Russell H. Taylor Copyright 1996-2022; 600.455/655 lecture notes

JHU Laboratory for Computational Sensing and Robotics

79

Digression: “rotation triple product”

Here are a few more useful facts:

$$\begin{aligned}\mathbf{R} \bullet (\vec{\mathbf{a}} \times \vec{\mathbf{b}}) &= (\mathbf{R} \bullet \vec{\mathbf{a}}) \times (\mathbf{R} \bullet \vec{\mathbf{b}}) \\ \vec{\mathbf{a}} \times (\mathbf{R} \bullet \vec{\mathbf{b}}) &= \mathbf{R} \bullet ((\mathbf{R}^{-1} \bullet \vec{\mathbf{a}}) \times \vec{\mathbf{b}})\end{aligned}$$

Consequently

$$\begin{aligned}skew(\vec{\mathbf{a}}) \bullet \mathbf{R} &= \mathbf{R} \bullet skew(\mathbf{R}^{-1} \bullet \vec{\mathbf{a}}) \\ \mathbf{R}^{-1} skew(\vec{\mathbf{a}}) \bullet \mathbf{R} &= skew(\mathbf{R}^{-1} \bullet \vec{\mathbf{a}})\end{aligned}$$

A “standard form” for linearized error expressions

It is often convenient to use identities to rearrange expressions involving small error variables into sums of terms with the general form $\mathbf{M}_k \vec{\eta}_k$, where \mathbf{M}_k involve things known to the computer, and the $\vec{\eta}_k$ are error variables.

For example,

$$\vec{\gamma} = \mathbf{R} sk(\vec{\alpha}) \vec{\mathbf{a}} + sk(\vec{\beta}) \vec{\mathbf{b}}$$

would be rewritten as

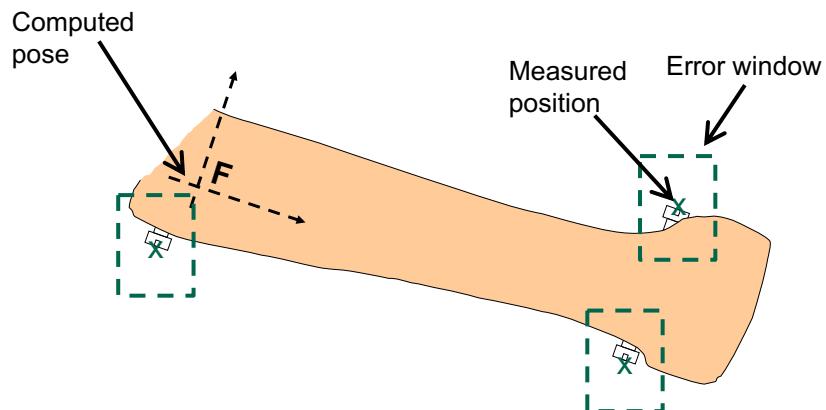

$$\vec{\gamma} = -\mathbf{R} sk(\vec{\alpha}) \vec{\mathbf{a}} - sk(\vec{\beta}) \vec{\mathbf{b}}$$

or

$$\vec{\gamma} = \mathbf{R} sk(-\vec{\mathbf{a}}) \vec{\alpha} + sk(-\vec{\mathbf{b}}) \vec{\beta}$$

Errors & Sensitivity

Previous expression was

$$\Delta \vec{v}_1 \approx \mathbf{R} \bullet (\Delta \vec{b}_1 + \vec{\alpha} \times \vec{b} + \Delta \vec{p}_1)$$

Substituting triple product and rearranging gives

$$\Delta \vec{v}_1 \approx \begin{bmatrix} \mathbf{R} & | & \mathbf{R} & | & \mathbf{R} \bullet skew(-\vec{b}) \end{bmatrix} \bullet \begin{bmatrix} \Delta \vec{b}_1 \\ \Delta \vec{p} \\ \vec{\alpha} \end{bmatrix}$$

So

$$\begin{bmatrix} -\varepsilon \\ -\varepsilon \\ -\varepsilon \end{bmatrix} \leq \begin{bmatrix} \mathbf{R} & | & \mathbf{R} & | & \mathbf{R} \bullet skew(-\vec{b}) \end{bmatrix} \begin{bmatrix} \Delta \vec{b}_1 \\ \Delta \vec{p} \\ \vec{\alpha} \end{bmatrix} \leq \begin{bmatrix} \varepsilon \\ \varepsilon \\ \varepsilon \end{bmatrix}$$

Errors & Sensitivity

Now, suppose we know that $|\Delta \vec{b}_1| \leq \beta$, this will give us a system of linear constraints

$$\begin{bmatrix} -\varepsilon \\ -\varepsilon \\ -\varepsilon \\ -\beta \\ -\beta \\ -\beta \end{bmatrix} \leq \begin{bmatrix} \mathbf{R} & | & \mathbf{R} & | & \mathbf{R} \bullet skew(-\vec{b}) \\ \mathbf{I} & | & \mathbf{0} & | & \mathbf{0} \end{bmatrix} \begin{bmatrix} \Delta \vec{b}_1 \\ \Delta \vec{p}_1 \\ \vec{\alpha} \end{bmatrix} \leq \begin{bmatrix} \varepsilon \\ \varepsilon \\ \varepsilon \\ \beta \\ \beta \\ \beta \end{bmatrix}$$

Error from frame composition

Consider $\mathbf{R}_1^*\mathbf{R}_2^* = \mathbf{R}_3^*$ where $\mathbf{R}_1^* = \mathbf{R}_1\Delta\mathbf{R}_1$, $\mathbf{R}_2^* = \mathbf{R}_2\Delta\mathbf{R}_2$, $\mathbf{R}_3^* = \mathbf{R}_3\Delta\mathbf{R}_3$ and $\Delta\mathbf{R}_1 \approx \mathbf{I} + sk(\vec{\alpha}_1)$, $\Delta\mathbf{R}_2 \approx \mathbf{I} + sk(\vec{\alpha}_2)$, estimate $\Delta\mathbf{R}_3 \approx \mathbf{I} + sk(\vec{\alpha}_3)$

$$\begin{aligned}\mathbf{R}_1\Delta\mathbf{R}_1\mathbf{R}_2\Delta\mathbf{R}_2 &= \mathbf{R}_1\mathbf{R}_2\Delta\mathbf{R}_3 \\ \mathbf{R}_1(\mathbf{I} + sk(\vec{\alpha}_1))\mathbf{R}_2(\mathbf{I} + sk(\vec{\alpha}_2)) &\approx \mathbf{R}_1\mathbf{R}_2(\mathbf{I} + sk(\vec{\alpha}_3)) \\ (\mathbf{R}_1\mathbf{R}_2)^{-1}\mathbf{R}_1(\mathbf{I} + sk(\vec{\alpha}_1))\mathbf{R}_2(\mathbf{I} + sk(\vec{\alpha}_2)) &\approx \mathbf{I} + sk(\vec{\alpha}_3) \\ \cancel{\mathbf{R}_2^{-1}\mathbf{R}_1}(\mathbf{I} + sk(\vec{\alpha}_1))\mathbf{R}_2(\mathbf{I} + sk(\vec{\alpha}_2)) &\approx \mathbf{I} + sk(\vec{\alpha}_3) \\ \mathbf{I} + \mathbf{R}_2^{-1}sk(\vec{\alpha}_1)\mathbf{R}_2 + sk(\vec{\alpha}_2) + \cancel{\mathbf{R}_2^{-1}sk(\vec{\alpha}_1)}\mathbf{R}_2sk(\vec{\alpha}_2) &\approx \mathbf{I} + sk(\vec{\alpha}_3) \\ \mathbf{R}_2^{-1}sk(\vec{\alpha}_1)\mathbf{R}_2 + sk(\vec{\alpha}_2) &\approx sk(\vec{\alpha}_3)\end{aligned}$$

Since $\mathbf{R}^{-1} \cdot (\vec{\mathbf{a}} \times \mathbf{R}\vec{\mathbf{b}}) = (\mathbf{R}^{-1}\vec{\mathbf{a}}) \times \vec{\mathbf{b}}$ for all $\mathbf{R}, \vec{\mathbf{a}}, \vec{\mathbf{b}}$ we get $\mathbf{R}_2^{-1}sk(\vec{\alpha}_1)\mathbf{R}_2 = sk(\mathbf{R}_2^{-1}\vec{\alpha}_1)$

$$\begin{aligned}sk(\vec{\alpha}_3) &\approx sk(\mathbf{R}_2^{-1}\vec{\alpha}_1) + sk(\vec{\alpha}_2) = sk(\mathbf{R}_2^{-1}\vec{\alpha}_1 + \vec{\alpha}_2) \\ \vec{\alpha}_3 &\approx \mathbf{R}_2^{-1}\vec{\alpha}_1 + \vec{\alpha}_2\end{aligned}$$

Russell H. Taylor Copyright 1996-2022; 600.455/655 lecture notes

JHU Laboratory for Computational Sensing and Robotics

96

Error from frame composition

Consider $\mathbf{F}_1^*\mathbf{F}_2^* = \mathbf{F}_3^*$ where $\mathbf{F}_1^* = \mathbf{F}_1\Delta\mathbf{F}_1$, $\mathbf{F}_2^* = \mathbf{F}_2\Delta\mathbf{F}_2$, $\mathbf{F}_3^* = \mathbf{F}_3\Delta\mathbf{F}_3$ and $\Delta\mathbf{F}_1 \approx [\mathbf{I} + sk(\vec{\alpha}_1), \vec{\epsilon}_1]$, $\Delta\mathbf{F}_2 \approx [\mathbf{I} + sk(\vec{\alpha}_2), \vec{\epsilon}_2]$, estimate $\Delta\mathbf{F}_3 \approx [\mathbf{I} + sk(\vec{\alpha}_3), \vec{\epsilon}_3]$

From before, we have $\vec{\alpha}_3 \approx \mathbf{R}_2^{-1}\vec{\alpha}_1 + \vec{\alpha}_2$. So now we just need $\vec{\epsilon}_3$.

$$\begin{aligned}\mathbf{F}_3\Delta\mathbf{F}_3 &= [\mathbf{R}_3\Delta\mathbf{R}_3, \mathbf{R}_3\Delta\vec{\mathbf{p}}_3 + \vec{\mathbf{p}}_3] \\ \vec{\mathbf{p}}_3 + \mathbf{R}_3\Delta\vec{\mathbf{p}}_3 &= \mathbf{R}_1(\Delta\mathbf{R}_1(\vec{\mathbf{p}}_2 + \mathbf{R}_2\vec{\epsilon}_2) + \vec{\epsilon}_1) + \vec{\mathbf{p}}_1 \\ \vec{\mathbf{p}}_3 + \mathbf{R}_3\vec{\epsilon}_3 &\approx \mathbf{R}_1(\mathbf{I} + sk(\vec{\alpha}_1))(\vec{\mathbf{p}}_2 + \mathbf{R}_2\vec{\epsilon}_2) + \mathbf{R}_1\vec{\epsilon}_1 + \vec{\mathbf{p}}_1 \\ &= \mathbf{R}_1\vec{\mathbf{p}}_2 + \mathbf{R}_1\mathbf{R}_2\vec{\epsilon}_2 + \mathbf{R}_1 \cdot (\vec{\alpha}_1 \times \vec{\mathbf{p}}_2 + \vec{\alpha}_1 \times \vec{\epsilon}_2) + \vec{\mathbf{p}}_1 + \mathbf{R}_1\vec{\epsilon}_1 \\ &= \vec{\mathbf{p}}_3 + \mathbf{R}_1\mathbf{R}_2\vec{\epsilon}_2 + \mathbf{R}_1 \cdot (\vec{\alpha}_1 \times \vec{\mathbf{p}}_2 + \vec{\alpha}_1 \times \vec{\epsilon}_2) + \mathbf{R}_1\vec{\epsilon}_1 \\ \mathbf{R}_3\vec{\epsilon}_3 &\approx \mathbf{R}_1\mathbf{R}_2\vec{\epsilon}_2 + \mathbf{R}_1 \cdot \vec{\alpha}_1 \times \vec{\mathbf{p}}_2 + \mathbf{R}_1\vec{\epsilon}_1 \\ \vec{\epsilon}_3 &\approx \cancel{\mathbf{R}_2^{-1}\mathbf{R}_1}\mathbf{R}_2\vec{\epsilon}_2 + \mathbf{R}_2^{-1}\cancel{\mathbf{R}_1}\mathbf{R}_1 \cdot \vec{\alpha}_1 \times \vec{\mathbf{p}}_2 + \mathbf{R}_2^{-1}\cancel{\mathbf{R}_1}\vec{\epsilon}_1 \\ &= \vec{\epsilon}_2 + \mathbf{R}_2^{-1} \cdot \vec{\alpha}_1 \times \vec{\mathbf{p}}_2 + \mathbf{R}_2^{-1}\vec{\epsilon}_1 \\ &= \vec{\epsilon}_2 - \mathbf{R}_2^{-1}sk(\vec{\mathbf{p}}_2)\vec{\alpha}_1 + \mathbf{R}_2^{-1}\vec{\epsilon}_1\end{aligned}$$

Inverse of frame transformation with errors

Suppose we know that $\Delta\mathbf{R}$ is "small", i.e., $\Delta\mathbf{R} \approx \mathbf{I} + sk(\vec{\alpha})$, and for notational convenience we write $\Delta\vec{\mathbf{p}} = \vec{\varepsilon}$, we get

$$\begin{aligned}
\Delta\mathbf{R}_i &= \mathbf{R}\Delta\mathbf{R}^{-1}\mathbf{R}^{-1} \approx \mathbf{R}(\mathbf{I} + sk(\vec{\alpha}))^{-1}\mathbf{R}^{-1} \\
&\approx \mathbf{R}(\mathbf{I} - sk(\vec{\alpha}))\mathbf{R}^{-1} \\
&= \mathbf{R}\mathbf{R}^{-1} - \mathbf{R}sk(\vec{\alpha})\mathbf{R}^{-1} \\
&= \mathbf{I} - \mathbf{R}sk(\vec{\alpha})\mathbf{R}^{-1} \\
&= \mathbf{I} - sk\left((\mathbf{R}^{-1})^{-1}\vec{\alpha}\right) = \mathbf{I} - sk(\mathbf{R}\vec{\alpha}) \\
\Delta\vec{\mathbf{p}}_i &= -\mathbf{R}\Delta\mathbf{R}^{-1}\Delta\vec{\mathbf{p}} - \mathbf{R}\Delta\mathbf{R}^{-1}\mathbf{R}^{-1}\vec{\mathbf{p}} + \vec{\mathbf{p}} \\
&\approx -\mathbf{R}(\mathbf{I} - sk(\vec{\alpha}))\vec{\varepsilon} - (\mathbf{I} - sk(\mathbf{R}\vec{\alpha}))\vec{\mathbf{p}} + \vec{\mathbf{p}} \\
&= -\mathbf{R}\vec{\varepsilon} + \mathbf{R}(\vec{\alpha} \times \vec{\varepsilon}) - \vec{\mathbf{p}} + (\mathbf{R}\vec{\alpha}) \times \vec{\mathbf{p}} + \vec{\mathbf{p}} \\
&\approx -\mathbf{R}\vec{\varepsilon} + (\mathbf{R}\vec{\alpha}) \times \vec{\mathbf{p}} = -\mathbf{R}\vec{\varepsilon} - \vec{\mathbf{p}} \times (\mathbf{R}\vec{\alpha}) = -\mathbf{R}\vec{\varepsilon} - sk(\vec{\mathbf{p}})\mathbf{R}\vec{\alpha} \\
(\text{also}) &= -\mathbf{R}\vec{\varepsilon} - ((\mathbf{R}\mathbf{R}^{-1}\vec{\mathbf{p}}) \times (\mathbf{R}\vec{\alpha})) = -\mathbf{R}\vec{\varepsilon} - \mathbf{R}((\mathbf{R}^{-1}\vec{\mathbf{p}}) \times \vec{\alpha}) \\
&= -\mathbf{R} \cdot (\vec{\varepsilon} + (\mathbf{R}^{-1}\vec{\mathbf{p}}) \times \vec{\alpha}) = -\mathbf{R}\vec{\varepsilon} - \mathbf{R}sk(\mathbf{R}^{-1}\vec{\mathbf{p}})\vec{\alpha}
\end{aligned}$$

Error Propagation in Chains

$$F^*_k = F^*_{k-1} \cdot F^*_{k-1,k}$$

$$F_k \Delta F_k = F_{k-1} \Delta F_{k-1} F_{k-1,k} \Delta F_{k-1,k}$$

$$\begin{aligned}\Delta F_k &= (F_k^{-1} F_{k-1}) \Delta F_{k-1} F_{k-1,k} \Delta F_{k-1,k} \\ &= (F_{k-1,k}^{-1} \Delta F_{k-1} F_{k-1,k}) \Delta F_{k-1,k}\end{aligned}$$

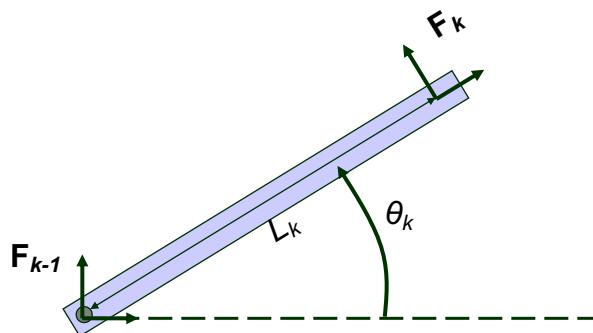

Russell H. Taylor Copyright 1996-2022; 600.455/655 lecture notes

JHU Laboratory for Computational Sensing and Robotics

103

Error Propagation in Chains

$$\begin{aligned}\Delta F_k &= (F_k^{-1} F_{k-1}) \Delta F_{k-1} F_{k-1,k} \Delta F_{k-1,k} \\ &= (F_{k-1,k}^{-1} \Delta F_{k-1} F_{k-1,k}) \Delta F_{k-1,k}\end{aligned}$$

$$\begin{aligned}\Delta R_k &= (R_{k-1,k}^{-1} \Delta R_{k-1} R_{k-1,k}) \Delta R_{k-1,k} \\ &\approx (R_{k-1,k}^{-1} (I + skew(\vec{\alpha}_{k-1})) R_{k-1,k}) (I + skew(\vec{\alpha}_{k-1,k})) \\ &\approx I + (R_{k-1,k}^{-1} skew(\vec{\alpha}_{k-1}) R_{k-1,k}) + skew(\vec{\alpha}_{k-1,k}) = I + skew(R_{k-1,k}^{-1} \vec{\alpha}_{k-1} + \vec{\alpha}_{k-1,k})\end{aligned}$$

Note: This is same as what we could have obtained by substituting in formulas from the "error from frame composition" slides given earlier.

JHU Laboratory for Computational Sensing and Robotics

104

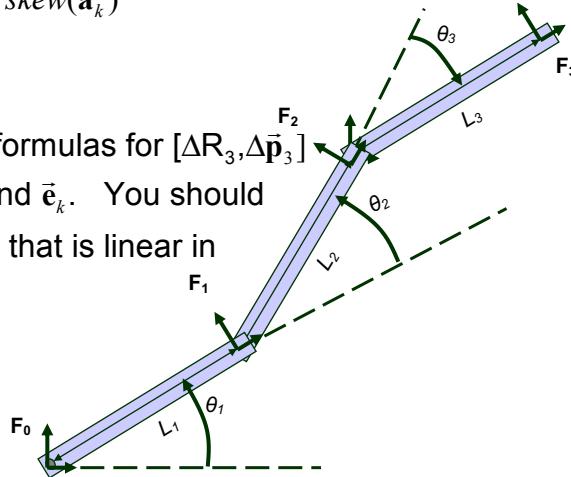

Exercise

Suppose that you have

$$\Delta \mathbf{R}_{k-1,k} = \Delta \mathbf{R}(\vec{\mathbf{a}}_k) \cong \mathbf{I} + skew(\vec{\mathbf{a}}_k)$$

$$\Delta \vec{\mathbf{p}}_{k-1,k} = \vec{\mathbf{e}}_k$$

Work out approximate formulas for $[\Delta \mathbf{R}_3, \Delta \vec{\mathbf{p}}_3]$ in terms of $L_k, \vec{\mathbf{r}}_k, \theta_k, \vec{\mathbf{a}}_k$ and $\vec{\mathbf{e}}_k$. You should come up with a formula that is linear in $L_k, \vec{\mathbf{a}}_k$, and $\vec{\mathbf{e}}_k$.

Russell H. Taylor Copyright 1996-2022; 600.455/655 lecture notes

JHU Laboratory for Computational Sensing and Robotics

105

Exercise

Suppose we want to know error in $\mathbf{F}_{0,3} = \mathbf{F}_0^{-1}\mathbf{F}_3$

$$\mathbf{F}_{0,3} = \mathbf{F}_0^{-1}\mathbf{F}_0\mathbf{F}_{0,1}\mathbf{F}_{1,2}\mathbf{F}_{2,3}$$

$$\mathbf{F}_{0,3} = \mathbf{F}_{0,1}\mathbf{F}_{1,2}\mathbf{F}_{2,3}$$

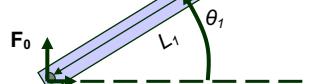

$$\mathbf{F}_{0,3}\Delta\mathbf{F}_{0,3} = \mathbf{F}_{0,1}\mathbf{F}_{1,2}\mathbf{F}_{2,3}$$

$$\Delta\mathbf{F}_3 = \mathbf{F}_{0,3}^{-1}\mathbf{F}_{0,1}\Delta\mathbf{F}_{0,1}\mathbf{F}_{1,2}\Delta\mathbf{F}_{1,2}\mathbf{F}_{2,3}\Delta\mathbf{F}_{2,3}$$

$$= \mathbf{F}_{2,3}^{-1}\mathbf{F}_{1,2}^{-1}\mathbf{F}_{0,1}^{-1}\mathbf{F}_{0,1}\Delta\mathbf{F}_{0,1}\mathbf{F}_{1,2}\Delta\mathbf{F}_{1,2}\mathbf{F}_{2,3}\Delta\mathbf{F}_{2,3}$$

$$= \mathbf{F}_{2,3}^{-1}\mathbf{F}_{1,2}^{-1}\Delta\mathbf{F}_{0,1}\mathbf{F}_{1,2}\Delta\mathbf{F}_{1,2}\mathbf{F}_{2,3}\Delta\mathbf{F}_{2,3}$$

Now substitute and simplify

JHU Laboratory for Computational Sensing and Robotics

112

Parametric Sensitivity

Suppose you have an explicit formula like

$$\vec{p}_3 = \begin{bmatrix} L_1 \cos(\theta_1) + L_2 \cos(\theta_1 + \theta_2) + L_3 \cos(\theta_1 + \theta_2 + \theta_3) \\ L_1 \sin(\theta_1) + L_2 \sin(\theta_1 + \theta_2) + L_3 \sin(\theta_1 + \theta_2 + \theta_3) \\ 0 \end{bmatrix}$$

and know that the only variation is in parameters like L_k and θ_k . Then you can estimate the variation in \vec{p}_3 as a function of variation in L_k and θ_k by remembering your calculus.

$$\Delta \vec{p}_3 \cong \begin{bmatrix} \frac{\partial \vec{p}_3}{\partial \vec{L}} & \frac{\partial \vec{p}_3}{\partial \vec{\theta}} \end{bmatrix} \begin{bmatrix} \Delta \vec{L} \\ \Delta \vec{\theta} \end{bmatrix}$$

Parametric Sensitivity

Grinding this out gives:

$$\Delta \vec{p}_3 \cong \begin{bmatrix} \frac{\partial \vec{p}_3}{\partial \vec{L}} & \frac{\partial \vec{p}_3}{\partial \vec{\theta}} \end{bmatrix} \begin{bmatrix} \Delta \vec{L} \\ \Delta \vec{\theta} \end{bmatrix}$$

where

$$\vec{L} = [L_1, L_2, L_3]^T$$

$$\vec{\theta} = [\theta_1, \theta_2, \theta_3]^T$$

$$\frac{\partial \vec{p}_3}{\partial \vec{L}} = \begin{bmatrix} \cos(\theta_1) & \cos(\theta_1 + \theta_2) & \cos(\theta_1 + \theta_2 + \theta_3) \\ \sin(\theta_1) & \sin(\theta_1 + \theta_2) & \sin(\theta_1 + \theta_2 + \theta_3) \\ 0 & 0 & 0 \end{bmatrix}$$

$$\frac{\partial \vec{p}_3}{\partial \vec{\theta}} = \begin{bmatrix} -L_1 \sin(\theta_1) - L_2 \sin(\theta_1 + \theta_2) - L_3 \sin(\theta_1 + \theta_2 + \theta_3) & -L_2 \sin(\theta_1 + \theta_2) - L_3 \sin(\theta_1 + \theta_2 + \theta_3) & -L_3 \sin(\theta_1 + \theta_2 + \theta_3) \\ L_1 \cos(\theta_1) + L_2 \cos(\theta_1 + \theta_2) + L_3 \cos(\theta_1 + \theta_2 + \theta_3) & L_2 \cos(\theta_1 + \theta_2) + L_3 \cos(\theta_1 + \theta_2 + \theta_3) & L_3 \cos(\theta_1 + \theta_2 + \theta_3) \\ 0 & 0 & 0 \end{bmatrix}$$

More generally ...

Suppose that we have a vector function

$$\bar{\mathbf{v}} = \bar{\mathbf{g}}(\bar{\mathbf{q}}) = [g_1(\bar{\mathbf{q}}), \dots, g_m(\bar{\mathbf{q}})]^T$$

of parameters $\bar{\mathbf{q}} = [q_1, \dots, q_n]$. Then we can estimate the value of

$$\bar{\mathbf{v}} + \Delta\bar{\mathbf{v}} = \bar{\mathbf{g}}(\bar{\mathbf{q}} + \Delta\bar{\mathbf{q}})$$

by

$$\bar{\mathbf{v}} + \Delta\bar{\mathbf{v}} \approx \bar{\mathbf{g}}(\bar{\mathbf{q}}) + \mathbf{J}_g(\bar{\mathbf{q}}) \bullet \Delta\bar{\mathbf{q}}$$

where

$$\mathbf{J}_g(\bar{\mathbf{q}}) = \begin{bmatrix} \frac{\partial g_1}{\partial q_1} & \frac{\partial g_1}{\partial q_j} & \frac{\partial g_1}{\partial q_n} \\ \vdots & \vdots & \vdots \\ \frac{\partial g_i}{\partial q_1} & \dots & \frac{\partial g_i}{\partial q_j} & \dots & \frac{\partial g_i}{\partial q_n} \\ \vdots & & \vdots & & \vdots \\ \frac{\partial g_m}{\partial q_1} & \frac{\partial g_m}{\partial q_j} & \frac{\partial g_m}{\partial q_n} \end{bmatrix}$$
