N-linear Interpolation

Let

$$\overline{\Lambda}_N = \{\lambda_1, \dots, \lambda_N\}, \text{ with } 0 \le \lambda_k \le 1$$

be a set of interpolation parameters, and let

$$\overline{\mathbf{A}} = \left\{ A_1, \dots, A_{2^N} \right\}$$

be a set of constants. Then we define:

NlinearInterpolate(Λ_N , **A**) =

$$(1 - \lambda_N)$$
NlinearInterpolate $(\Lambda_{N-1}, \{A_1, ..., A_{2^{N-1}}\})$
+ λ_N NlinearInterpolate $(\Lambda_{N-1}, \{A_{2^{N-1}+1}, ..., A_{2^N}\})$

NOTE: Sometimes in this situation we will use notation

$$A(\overline{\Lambda}_N) = A(\lambda_1, ..., \lambda_N)$$

= NlinearInterpolate($\overline{\Lambda}_N, \overline{\mathbf{A}}$)

Y

Barycentric Interpolation

Let

$$\vec{\Lambda} = \{\lambda_1, \dots, \lambda_N\}, \text{ with } 0 \le \lambda_k \le 1 \text{ and } \sum_{k=1}^N \lambda_k = 1$$

be a set of interpolation parameters, and let

$$\vec{\mathbf{A}} = \left\{ A_1, \dots, A_{2^N} \right\}$$

be a set of constants. Then we define:

BarycentricInterpolate
$$(\vec{\Lambda}, \vec{\mathbf{A}}) = \vec{\Lambda} \cdot \vec{\mathbf{A}} = \sum_{k=1}^{N} \lambda_k A_k$$

NOTE: Sometimes in this situation we will use notation

$$\mathbf{A}(\Lambda_N) = \mathbf{A}(\lambda_1, \dots, \lambda_N) = \text{BarycentricInterpolate}(\Lambda_N, \mathbf{A})$$

NOTE: This is a special case of barycentric Bezier polynomial interpolations (here, 1st degree)

Engineering Research Center for Computer Integrated Surgical Systems and Technology

1-D Interpolation

Given set of known values $\{y_0(v_0),...,y_m(v_m)\}$, find an approximating polynomial $y \approx P(c_0,...,c_N;v)$

$$P(c_0,...,c_N;v) = \sum_{k=0}^{N} c_k P_{N,k}(v)$$

Note that many forms of polynomial may be used for the $P_{N,k}(v)$. One common (not very good) choice is the power basis:

$$P_{N,k}(v) = v^k$$

Better choices are the Bernstein polynomials and the B-spline basis functions, which we will discuss in a moment

17 600.445 Fall 2000; Updated: 30 September 2021 Copyright © R. H. Taylor

Engineering Research Center for Computer Integrated Surgical Systems and Technology

17

1-D Interpolation

Given set of known values $\{y_0(v_0),...,y_m(v_m)\}$, find an approximating polynomial $y \approx P(c_0,...,c_N;v)$

$$P(c_0,...,c_N;v) = \sum_{k=0}^{N} c_k P_{N,k}(v)$$

To do this, solve:

$$\begin{bmatrix}
P_{N,0}(v_0) & \cdots & P_{N,N}(v_0) \\
\vdots & \ddots & \vdots \\
P_{N,0}(v_m) & \cdots & P_{N,N}(v_m)
\end{bmatrix}
\begin{bmatrix}
c_0 \\
\vdots \\
c_N
\end{bmatrix}
\approx
\begin{bmatrix}
y_0 \\
\vdots \\
y_m
\end{bmatrix}$$

Bezier Curves

Suppose that the coefficients $\overrightarrow{c_j}$ are multi-dimensional vectors (e.g., 2D or 3D points). Then the polynomial

$$P\left(\overrightarrow{c_0},...,\overrightarrow{c_N};v\right) = \sum_{k=0}^{N} \overrightarrow{c_k} B_{N,k}(v)$$

computed over the range $0 \le v \le 1$ generates a Bezier curve with control vertices $\overrightarrow{c_i}$.

B-splines

Given

coefficient values $\bar{\mathbf{C}} = \{\vec{c}_0, \cdots, \vec{c}_{L+D-1}\}$

"knot points" $\overline{\mathbf{u}} = \{u_0, \dots, u_{L+2D-2}\}$ with $u_i \le u_{i+1}$

D = "degree" of desired B-spline

Can define an interpolated curve $P(\overline{\mathbf{C}},\overline{\mathbf{u}};\ u)$ on $u_{D-1} \leq u < u_{L+D-1}$

Then

$$P(\bar{\mathbf{C}};u) = \sum_{j=0}^{L+D-1} \bar{c}_j \ N_j^D(u)$$

where $N_{j}^{D}(u)$ are B-spline basis polynomials (discussed later)

Engineering Research Center for Computer Integrated Surgical Systems and Technology

B-Spline Polynomials

For a B-spline polynomial

$$P(\overline{\mathbf{C}}, \overline{\mathbf{u}}; t) = \sum_{j=0}^{L+D-1} \overline{\mathbf{c}}_j \ N_j^D(\overline{\mathbf{u}}, t)$$

the basis functions $N_j^D(\bar{\mathbf{u}},t)$ are a function of the degree of the polynomial and the vector $\bar{\mathbf{u}} = [u_0, \cdots, u_n]$ of "knot points". The polynomial is "uniform" if the distance between knot points is evenly spaced and "non-uniform" otherwise.

2D Interpolation: Sampling on a regular grid

A common special case arises when the (u_s, v_s) form a regular grid. In this case we have $u_s \in \{u_0, \cdots, u_{N_u}\}$ and $v_s \in \{v_0, \cdots, v_{N_v}\}$. For each value $v_i \in \{v_0, \cdots, v_{N_v}\}$ solve the N_s row least squares problem

$$\begin{bmatrix} \vdots \\ \mathbf{y}_s(u_s, v_j) \\ \vdots \end{bmatrix} \approx \begin{bmatrix} \vdots & \cdots & \vdots \\ A_0(u_s) & \cdots & A_m(u_s) \\ \vdots & \cdots & \vdots \end{bmatrix} \bullet \begin{bmatrix} \mathbf{X}_{j0} \\ \vdots \\ \mathbf{X}_{jm} \end{bmatrix}$$

for the unknown m-vector \mathbf{X}_{i} . Then solve m n-variable least squares problems

$$\begin{bmatrix} \mathbf{X}_{00} & \mathbf{X}_{01} & \cdots & \mathbf{X}_{0m} \\ \mathbf{X}_{10} & \mathbf{X}_{11} & \cdots & \mathbf{X}_{1m} \\ \vdots & \vdots & \ddots & \vdots \\ \vdots & \vdots & \ddots & \vdots \\ \mathbf{X}_{N_{\nu},0} & \mathbf{X}_{N_{\nu},1} & \cdots & \mathbf{X}_{N_{\nu},m} \end{bmatrix} \approx \begin{bmatrix} B_{0}(v_{0}) & B_{1}(v_{0}) & \cdots & B_{n}(v_{0}) \\ B_{0}(v_{1}) & B_{1}(v_{1}) & \cdots & B_{n}(v_{1}) \\ \vdots & \vdots & \ddots & \vdots \\ \vdots & \vdots & \ddots & \vdots \\ B_{0}(v_{N_{\nu}}) & B_{1}(v_{N_{\nu}}) & \cdots & B_{n}(v_{N_{\nu}}) \end{bmatrix} \bullet \begin{bmatrix} \mathbf{c}_{00} & \mathbf{c}_{10} & \cdots & \mathbf{c}_{m0} \\ \mathbf{c}_{01} & \mathbf{c}_{11} & \cdots & \mathbf{c}_{m1} \\ \vdots & \vdots & \ddots & \vdots \\ \mathbf{c}_{0n} & \mathbf{c}_{1n} & \cdots & \mathbf{c}_{mn} \end{bmatrix}$$

for the vectors $\left[\mathbf{c}_{j_0},\cdots,\mathbf{c}_{j_n}\right]$. Note that this latter step requires only 1 SVD or similar matrix computation.

2D Interpolation: Sampling on a regular grid

- There are a number of caveats to the "grid" method on the previous slide. (E.g., you need enough data for each of the least squares problems). But where applicable the method can save computation time since it replaces a number of m and n variable least squares problems for one big m x n problem
- Note that there is a similar trick that you can play by grouping all the common u_i elements together.
- Note that the y's and the c's do not have to be scalar numbers. They can be Vectors, Matrices, or other objects that have appropriate algebraic properties

g

N-dimensional interpolation

Define

$$F_{i_1\cdots i_N}(\vec{\mathbf{u}}) = A^1_{i_1}(u_1)\cdots A^N_{i_N}(u_N)$$

Then solve the least squares problem

$$\begin{bmatrix} \boldsymbol{F}_{00\cdots0}(\vec{\mathbf{u}}_{s}) & \boldsymbol{F}_{10\cdots0}(\vec{\mathbf{u}}_{s}) & \cdots & \boldsymbol{F}_{m_{1}\cdots m_{n}}(\vec{\mathbf{u}}_{s}) \end{bmatrix} \begin{bmatrix} \boldsymbol{c}_{00\cdots0} \\ \boldsymbol{c}_{10\cdots0} \\ \vdots \\ \boldsymbol{c}_{m_{1}\cdots m_{n}} \end{bmatrix} \cong \begin{bmatrix} \vdots \\ \vec{\mathbf{y}}_{s} \\ \vdots \end{bmatrix}$$

44

N-dimensional interpolation

 The methods described earlier generalize naturally to N dimensions.

$$P(\mathbf{\bar{u}}) = P(u_1, \dots, u_N) = \sum_{i_1=0}^{m_1} \dots \sum_{i_N=0}^{m_N} c_{i_1 \dots i_N} A^1_{i_1}(u_1) \dots A^N_{i_N}(u_N)$$

where $A_i^{\kappa}(u)$ can be arbitrary functions

(good choices are Bernstein polynomials or

B-Spline basis functions). Suppose that we have samples

$$\mathbf{y_s} = \mathbf{y}(\vec{\mathbf{u}}_s)$$
 for $s = 0,...,N_s$

We want to find coefficients of $c_{i_1\cdots i_n}$ approximating polynomial P.

Engineering Research Center for Computer Integrated Surgical Systems and Technology

Example: 3D Calibration of Distortion

Suppose we want to compute a distortion correction function for a distorted 3D navigational sensor. Let

- $\vec{\mathbf{p}}_i = \text{known 3D "ground truth"}$
- $\vec{\mathbf{q}}_i$ = Values returned by navigational sensor

Here we will construct a "tensor form" interpolation polynomial using 5th degree Bernstein polynomials

$$F_{ijk}(u_x, u_y, u_z) = B_{5,i}(u_x)B_{5,j}(u_y)B_{5,k}(u_z)$$

We need to do the following:

1. Bernstein polynomials are really designed to work well in the range $0 \le u \le 1$, so we need to determine a "bounding box" to scale our $\vec{\mathbf{q}}_i$ values. I.e., we pick upper and lower limits $\vec{\mathbf{q}}^{\text{min}}$ and $\vec{\mathbf{q}}^{\text{max}}$ and compute $\vec{\mathbf{u}}_s = ScaleToBox(\vec{\mathbf{q}}_s, \vec{\mathbf{q}}^{\text{min}}, \vec{\mathbf{q}}^{\text{max}})$ where

ScaleToBox
$$(x, x^{\min}, x^{\max}) = \frac{x - x^{\min}}{x^{\max} - x^{\min}}$$

2. Now, we set up and solve the least squares problem:

Engineering Research Center for Computer Integrated Surgical Systems and Technology

46

Example: 3D Calibration of Distortion

$$\begin{bmatrix} & \vdots & & & \\ & F_{000}(\vec{\mathbf{u}}_{s}) & \cdots & F_{555}(\vec{\mathbf{u}}_{s}) & \\ & \vdots & & \vdots & \vdots & \vdots \\ & & \vdots & & c_{555}^{x} & c_{555}^{y} & c_{555}^{z} \end{bmatrix} \approx \begin{bmatrix} & \vdots & & \\ & p_{s}^{x} & p_{s}^{y} & p_{s}^{z} \\ & \vdots & & \vdots & \end{bmatrix}$$

600.445 Fall 2000; Updated: 30 September 2021 Copyright © R. H. Taylor

Engineering Research Center for Computer Integrated Surgical Systems and Technology

Example: 3D Calibration of Distortion

The correction function will then look like this:

$$\begin{split} \vec{\mathbf{p}} &= Correct Distortion(\vec{\mathbf{q}}) \\ \{ & \quad \vec{\mathbf{u}} = Scale To Box(\vec{\mathbf{q}}, \vec{\mathbf{q}}^{\min}, \vec{\mathbf{q}}^{\max}) \\ & \quad \text{return } \sum_{i=0}^{5} \sum_{j=0}^{5} \vec{\mathbf{c}}_{i,j,k} B_{5,i}(u_x) B_{5,j}(u_y) B_{5,k}(u_z) \\ \} \end{split}$$

48

Radial Basis Function Interpolation

$$\vec{\mathbf{f}}(\vec{\mathbf{x}}) = \sum_{k=1}^{n} \vec{\mathbf{f}}_{k} \varphi(||\vec{\mathbf{x}} - \vec{\mathbf{x}}_{k}||)$$
 where $\vec{\mathbf{x}} \in \mathbb{R}^{d}$

Given a set of points $\{\cdots \vec{\mathbf{x}}_{k}\cdots\}$, solve this system to find the $\vec{\mathbf{f}}_{k}$:

$$\begin{bmatrix} 0 & \varphi(\left\|\vec{\mathbf{x}}_{2} - \vec{\mathbf{x}}_{1}\right\|) & \cdots & \varphi(\left\|\vec{\mathbf{x}}_{n} - \vec{\mathbf{x}}_{1}\right\|) \\ \varphi(\left\|\vec{\mathbf{x}}_{1} - \vec{\mathbf{x}}_{2}\right\|) & 0 & \cdots & \varphi(\left\|\vec{\mathbf{x}}_{n} - \vec{\mathbf{x}}_{2}\right\|) \\ \vdots & \vdots & \ddots & \vdots \\ \varphi(\left\|\vec{\mathbf{x}}_{1} - \vec{\mathbf{x}}_{n}\right\|) & \varphi(\left\|\vec{\mathbf{x}}_{2} - \vec{\mathbf{x}}_{n}\right\|) & \cdots & 0 \end{bmatrix} \begin{bmatrix} \vec{\mathbf{f}}_{1}^{T} \\ \vec{\mathbf{f}}_{2}^{T} \\ \vdots \\ \vec{\mathbf{f}}_{n}^{T} \end{bmatrix} = \begin{bmatrix} \vec{\mathbf{x}}_{1}^{T} \\ \vec{\mathbf{x}}_{2}^{T} \\ \vdots \\ \vec{\mathbf{x}}_{n}^{T} \end{bmatrix}$$

Sometimes add linear combination of polynomials $\vec{\gamma}_i(\vec{\mathbf{x}})$ to the method

$$\vec{\mathbf{f}}(\vec{\mathbf{x}}) = \sum_{k=1}^{n} \vec{\mathbf{f}}_{k} \varphi(||\vec{\mathbf{x}} - \vec{\mathbf{x}}_{k}||) + \sum_{j=1}^{m} \vec{\mathbf{g}}_{j} \gamma_{j}(\vec{\mathbf{x}}) \text{ where } \sum_{k=1}^{n} \vec{\mathbf{g}}_{k} \gamma_{k}(\vec{\mathbf{x}}_{k}) = 0$$

Radial Basis Function Interpolation

$$\vec{\mathbf{f}}(\vec{\mathbf{x}}) = \sum_{k=1}^{n} \vec{\mathbf{f}}_{k} \varphi(\left| \left| \vec{\mathbf{x}} - \vec{\mathbf{x}}_{k} \right| \right|) \quad \text{where } \vec{\mathbf{x}} \in \mathbb{R}^{d}$$

Typical radial basis functions with global support^[1]

Radial Basis Function	$\phi(r)$	parameters	order
Gaussians	$e^{-(cr)^2}$	c > 0	0
Polyharmonic Splines	r^{2k-1}	$k\in\mathbb{N}$	m = k
	$r^{2k}\log(r)$	$k\in\mathbb{N}$	m = k + 1
Multiquadrics	$\sqrt{r^2 + c^2}$	c > 0	1
Inverse Multiquadrics	$\frac{1}{\sqrt{r^2+c^2}}$	c > 0	0
Inverse Quadratics	$\frac{1}{r^2+c^2}$	c > 0	0

[1] W. du Toit, Radial Basis Function Interpolation,, MS Thesis, University of Stellenbosch, 2008

Example radial basis function with compact support

$$\varphi(r) = \begin{cases} e^{-\left(\frac{1}{1 - (\varepsilon r)^2}\right)} & \text{for } 0 \le r < \frac{1}{\varepsilon} \\ 0 & \text{otherwise.} \end{cases}$$

Note: The choice of constants in design of RBFs is important

Radial Basis Function Interpolation

- As mentioned in the previous slide, the choice of specific RBF basis and associated parameters is important and is generally problem-specific. The design process typically involves an optimization problem of some sort, trading off accuracy, coverage, and computational efficiency.
