8

N-linear Interpolation

Let

$$\bar{\Lambda}_N = \{\lambda_1, \dots, \lambda_N\}, \text{ with } 0 \leq \lambda_k \leq 1$$

be a set of interpolation parameters, and let

$$\bar{\mathbf{A}} = \{A_1, \dots, A_{2^N}\}$$

be a set of constants. Then we define:

$$\begin{aligned} \text{NlinearInterpolate}(\Lambda_N, \mathbf{A}) = & \\ & (1 - \lambda_N) \text{NlinearInterpolate}(\Lambda_{N-1}, \{A_1, \dots, A_{2^{N-1}}\}) \\ & + \lambda_N \text{NlinearInterpolate}(\Lambda_{N-1}, \{A_{2^{N-1}+1}, \dots, A_{2^N}\}) \end{aligned}$$

NOTE: Sometimes in this situation we will use notation

$$\begin{aligned} A(\bar{\Lambda}_N) &= A(\lambda_1, \dots, \lambda_N) \\ &= \text{NlinearInterpolate}(\bar{\Lambda}_N, \bar{\mathbf{A}}) \end{aligned}$$

9

Barycentric Interpolation

10

Barycentric Interpolation

$$\begin{aligned}\bar{\mathbf{p}}(\lambda, \mu) &= \bar{\mathbf{p}}_3 + \lambda(\bar{\mathbf{p}}_1 - \bar{\mathbf{p}}_3) + \mu(\bar{\mathbf{p}}_2 - \bar{\mathbf{p}}_3) \\ &= \lambda\bar{\mathbf{p}}_1 + \mu\bar{\mathbf{p}}_2 + (1 - \lambda - \mu)\bar{\mathbf{p}}_3\end{aligned}$$

$$\bar{\mathbf{p}}(\lambda, \mu, \nu) = \lambda\bar{\mathbf{p}}_1 + \mu\bar{\mathbf{p}}_2 + \nu\bar{\mathbf{p}}_3 \quad \text{where } \lambda + \mu + \nu = 1$$

$$A(\lambda, \mu, \nu) = \lambda A_1 + \mu A_2 + \nu A_3$$

11 600.445 Fall 2000; Updated: 5 October 2021
Copyright © R. H. Taylor

Engineering Research Center for Computer Integrated Surgical Systems and Technology

11

Barycentric Interpolation

$$\begin{bmatrix} \bar{\mathbf{p}} \\ 1 \end{bmatrix} = \begin{bmatrix} \bar{\mathbf{p}}_1 & \bar{\mathbf{p}}_2 & \bar{\mathbf{p}}_3 \\ 1 & 1 & 1 \end{bmatrix} \begin{bmatrix} \lambda \\ \mu \\ \nu \end{bmatrix}$$

12

Barycentric Interpolation

Let

$$\vec{\Lambda} = \{\lambda_1, \dots, \lambda_N\}, \text{ with } 0 \leq \lambda_k \leq 1 \text{ and } \sum_{k=1}^N \lambda_k = 1$$

be a set of interpolation parameters, and let

$$\vec{\mathbf{A}} = \{A_1, \dots, A_{2N}\}$$

be a set of constants. Then we define:

$$\text{BarycentricInterpolate}(\vec{\Lambda}, \vec{\mathbf{A}}) = \vec{\Lambda} \cdot \vec{\mathbf{A}} = \sum_{k=1}^N \lambda_k A_k$$

NOTE: Sometimes in this situation we will use notation

$$\mathbf{A}(\Lambda_N) = \mathbf{A}(\lambda_1, \dots, \lambda_N) = \text{BarycentricInterpolate}(\Lambda_N, \mathbf{A})$$

NOTE: This is a special case of barycentric Bezier polynomial interpolations (here, 1st degree)

Barycentric Interpolation

Given $n+1$ n -dimensional points $\vec{\mathbf{a}}_0 \dots \vec{\mathbf{a}}_n$ and a test point $\vec{\mathbf{a}}_{test}$ find barycentric coordinates $\vec{\lambda} = [\lambda_0, \dots, \lambda_n]$ such that $\vec{\mathbf{a}}_{test} = \sum_k \lambda_k \vec{\mathbf{a}}_k$ and $\sum_k \lambda_k = 1$.

Solve

$$\begin{bmatrix} \vec{\mathbf{a}}_0 & \dots & \vec{\mathbf{a}}_n \\ 1 & \dots & 1 \end{bmatrix} \begin{bmatrix} \lambda_0 \\ \vdots \\ \lambda_n \end{bmatrix} = \begin{bmatrix} \vec{\mathbf{a}}_{test} \\ 1 \end{bmatrix}$$

Barycentric Interpolation (projection case)

Given only n n -dimensional points $\vec{a}_1 \dots \vec{a}_n$ and a test point \vec{a}_{test} find barycentric coordinates $\vec{\lambda} = [\lambda_0, \dots, \lambda_n]$ such that $\vec{a}_{test} = \sum_k \lambda_k \vec{a}_k$ and $\sum_k \lambda_k = 1$.

Solve

$$\begin{bmatrix} \vec{a}_1 & \dots & \vec{a}_n \\ 1 & \dots & 1 \end{bmatrix} \begin{bmatrix} \lambda_0 \\ \vdots \\ \lambda_n \end{bmatrix} \approx \begin{bmatrix} \vec{a}_{test} \\ 1 \end{bmatrix}$$

in a least-squares sense.

Note that this is useful in many cases where you want to store a pseudo-inverse for a triangle, tetrahedron, or other low-dimensional object for repeated interpolations.

Interpolation of functions

Fitting of interpolation curves

- The discussion below follows (in part)

G. Farin, Curves and surfaces for computer-aided geometric design, a practical guide, Academic Press, Boston, 1990, chapter 10 and pp 281-284.

1-D Interpolation

Given set of known values $\{y_0(v_0), \dots, y_m(v_m)\}$,

find an approximating polynomial $y \approx P(c_0, \dots, c_N; v)$

$$P(c_0, \dots, c_N; v) = \sum_{k=0}^N c_k P_{N,k}(v)$$

Note that many forms of polynomial may be used for the $P_{N,k}(v)$. One common (not very good) choice is the power basis:

$$P_{N,k}(v) = v^k$$

Better choices are the Bernstein polynomials and the B-spline basis functions, which we will discuss in a moment

1-D Interpolation

Given set of known values $\{y_0(v_0), \dots, y_m(v_m)\}$,
find an approximating polynomial $y \approx P(c_0, \dots, c_N; v)$

$$P(c_0, \dots, c_N; v) = \sum_{k=0}^N c_k P_{N,k}(v)$$

To do this, solve:

$$\begin{bmatrix} P_{N,0}(v_0) & \dots & P_{N,N}(v_0) \\ \vdots & \ddots & \vdots \\ P_{N,0}(v_m) & \dots & P_{N,N}(v_m) \end{bmatrix} \begin{bmatrix} c_0 \\ \vdots \\ c_N \end{bmatrix} \approx \begin{bmatrix} y_0 \\ \vdots \\ y_m \end{bmatrix}$$

Bezier and Bernstein Polynomials

$$\begin{aligned} P(c_0, \dots, c_N; v) &= \sum_{k=0}^N c_k \binom{N}{k} (1-v)^{N-k} v^k \\ &= \sum_{k=0}^N c_k B_{N,k}(v) \end{aligned}$$

where $B_{N,k}(v) = \binom{N}{k} (1-v)^{N-k} v^k$

- Excellent numerical stability for $0 < v < 1$
- There exist good ways to convert to more conventional power basis

Barycentric Bezier Polynomials

$$P(c_0, \dots, c_N; u, v) = \sum_{k=0}^N c_k \binom{N}{k} u^{N-k} v^k$$

$$= \sum_{k=0}^N c_k B_{N,k}(u, v)$$

where $B_{N,k}(u, v) = \binom{N}{k} u^{N-k} v^k \quad u+v=1$

- Excellent numerical stability for $0 < u, v < 1$
- There exist good ways to convert to more conventional power basis

Bezier Curves

Suppose that the coefficients \vec{c}_j are multi-dimensional vectors (e.g., 2D or 3D points). Then the polynomial

$$P(\vec{c}_0, \dots, \vec{c}_N; v) = \sum_{k=0}^N \vec{c}_k B_{N,k}(v)$$

computed over the range $0 \leq v \leq 1$ generates a Bezier curve with control vertices \vec{c}_j .

Engineering Research Center for Computer Integrated Surgical Systems and Technology

22

Bezier Curves: de Casteljau Algorithm

Given coefficients \vec{c}_j , Bezier curves can be generated recursively by repeated linear interpolation:

$$P(\vec{c}_0, \dots, \vec{c}_N; v) = b_0^N$$

where

$$b_j^0 = \vec{c}_j$$

$$b_j^k = (1-v)b_j^{k-1} + vb_{j+1}^{k-1}$$

23 600.445 Fall 2000; Updated: 5 October 2021
Copyright © R. H. Taylor

Engineering Research Center for Computer Integrated Surgical Systems and Technology

23

Iterative Form of deCasteljau Algorithm

Step 1: $b_j \leftarrow c_j$ for $0 \leq j \leq N$

Step 2: for $k \leftarrow 1$ step 1 until $k = N$ do

for $j \leftarrow 0$ step 1 until $j = N - k$ do

$$b_j \leftarrow (1-v)b_j + vb_{j+1}$$

Step 3: return b_0

24

Advantages of Bezier Curves

- Numerically very robust
- Many nice mathematical properties
- Smooth

- “Global” (may be viewed as a disadvantage)

B-splines

Given

coefficient values $\bar{\mathbf{C}} = \{\bar{c}_0, \dots, \bar{c}_{L+D-1}\}$

"knot points" $\bar{\mathbf{u}} = \{u_0, \dots, u_{L+2D-2}\}$ with $u_i \leq u_{i+1}$

D = "degree" of desired B-spline

Can define an interpolated curve $P(\bar{\mathbf{C}}, \bar{\mathbf{u}}; u)$ on $u_{D-1} \leq u < u_{L+D-1}$

Then

$$P(\bar{\mathbf{C}}; u) = \sum_{j=0}^{L+D-1} \bar{c}_j N_j^D(u)$$

where $N_j^D(u)$ are B-spline basis polynomials (discussed later)

B-Spline Polynomials

Some useful references include

- <http://en.wikipedia.org/wiki/B-spline>

B-spline polynomials & B-spline basis functions

Given $\bar{\mathbf{C}}, \bar{\mathbf{u}}, D$ as before

$$P(\bar{\mathbf{C}}, \bar{\mathbf{u}}; u) = \sum_{j=0}^{L+D-1} \bar{c}_j N_j^D(u)$$

where

$$N_j^0(u) = \begin{cases} 1 & u_{j-1} \leq u \leq u_j \\ 0 & \text{Otherwise} \end{cases}$$

$$N_j^k(u) = \frac{u - u_{j-1}}{u_{j+k-1} - u_{j-1}} N_j^{k-1}(u) + \frac{u_{j+k} - u}{u_{j+k} - u_j} N_{j+1}^{k-1}(u) \text{ for } k > 0$$

B-Spline Polynomials

For a B-spline polynomial

$$P(\bar{\mathbf{c}}, \bar{\mathbf{u}}; t) = \sum_{j=0}^{L+D-1} \bar{c}_j N_j^D(\bar{\mathbf{u}}, t)$$

the basis functions $N_j^D(\bar{\mathbf{u}}, t)$ are a function of the degree of the polynomial and the vector $\bar{\mathbf{u}} = [u_0, \dots, u_n]$ of "knot points". The polynomial is "uniform" if the distance between knot points is evenly spaced and "non-uniform" otherwise.

deBoor Algorithm (Farin)

Given \mathbf{u} , \mathbf{c} , D as before, can evaluate $P(\mathbf{c}, \mathbf{u}; u)$

recursively as follows:

Step 1: Determine index i such that $u_i \leq u < u_{i+1}$

Step 2: Determine multiplicity r such that

$$u_{i-r} = u_{i-r+1} = \dots = u_i$$

Step 3: Set $\bar{\mathbf{d}}_j^0 = c_j$ for $i - D + 1 \leq j \leq i + 1$

Step 4: Compute $P(\mathbf{c}, \mathbf{u}; u) = d_{i+1}^{D-r}$ recursively, where

$$\bar{\mathbf{d}}_j^k = \frac{u_{j+D-k} - u}{u_{j+D-k} - u_{j-1}} \bar{\mathbf{d}}_{j-1}^{k-1} + \frac{u - u_{j-1}}{u_{j+D-k} - u_{j-1}} \bar{\mathbf{d}}_j^{k-1} = \frac{\alpha_j^k \bar{\mathbf{d}}_{j-1}^{k-1}}{\gamma_j^k} + \frac{\beta_j^k \bar{\mathbf{d}}_j^{k-1}}{\gamma_j^k}$$

deBoor Algorithm: Example D=3, r=0

$$\bar{d}_j^k = \frac{u_{j+D-k}-u}{u_{j+D-k}-u_{j-1}} \bar{d}_{j-1}^{k-1} + \frac{u-u_{j-1}}{u_{j+D-k}-u_{j-1}} \bar{d}_j^{k-1} = \frac{\alpha_j^k \bar{d}_{j-1}^{k-1}}{\gamma_j^k} + \frac{\beta_j^k \bar{d}_j^{k-1}}{\gamma_j^k}$$

$$\bar{d}_{i+1}^{3-0} = \bar{p}(\{\dots, \bar{c}_i, \dots\}, 3; u)$$

$$= \left(\alpha_{i+1}^3 \bar{d}_i^2 + \beta_{i+1}^3 \bar{d}_{i+1}^2 \right) / \gamma_{i+1}^3 = \left((u_{i+1}-u) \bar{d}_i^2 + (u-u_i) \bar{d}_{i+1}^2 \right) / (u_{i+1}-u_i)$$

$$\bar{d}_{i+1}^2 = \left(\alpha_{i+1}^2 \bar{d}_i^1 + \beta_{i+1}^2 \bar{d}_{i+1}^1 \right) / \gamma_{i+1}^2 = \left((u_{i+2}-u) \bar{d}_i^1 + (u-u_i) \bar{d}_{i+1}^1 \right) / (u_{i+2}-u_i)$$

$$\bar{d}_i^2 = \left(\alpha_i^2 \bar{d}_{i-1}^1 + \beta_i^2 \bar{d}_i^1 \right) / \gamma_i^2 = \left((u_{i+1}-u) \bar{d}_{i-1}^1 + (u-u_{i-1}) \bar{d}_i^1 \right) / (u_{i+1}-u_{i-1})$$

$$\bar{d}_{i+1}^1 = \left(\alpha_{i+1}^1 \bar{d}_i^0 + \beta_{i+1}^1 \bar{d}_{i+1}^0 \right) / \gamma_{i+1}^1 = \left((u_{i+3}-u) \bar{d}_i^0 + (u-u_i) \bar{d}_{i+1}^0 \right) / (u_{i+3}-u_i)$$

$$\bar{d}_i^1 = \left(\alpha_i^1 \bar{d}_{i-1}^0 + \beta_i^1 \bar{d}_i^0 \right) / \gamma_i^1 = \left((u_{i+2}-u) \bar{d}_{i-1}^0 + (u-u_{i-1}) \bar{d}_i^0 \right) / (u_{i+2}-u_{i-1})$$

$$\bar{d}_{i-1}^1 = \left(\alpha_{i-1}^1 \bar{d}_{i-2}^0 + \beta_{i-1}^1 \bar{d}_{i-1}^0 \right) / \gamma_{i-1}^1 = \left((u_{i+1}-u) \bar{d}_{i-2}^0 + (u-u_{i-2}) \bar{d}_{i-1}^0 \right) / (u_{i+1}-u_{i-2})$$

40

2D Interpolation (tensor form)

Consider the 2D polynomial

$$P(u,v) = \sum_{i=0}^m \sum_{j=0}^n c_{ij} A_i(u) B_j(v)$$

$$= [A_0(u), \dots, A_m(u)] \begin{bmatrix} c_{00} & \dots & c_{0n} \\ \vdots & \ddots & \vdots \\ c_{m0} & \dots & c_{mn} \end{bmatrix} \begin{bmatrix} B_0(v) \\ \vdots \\ B_n(v) \end{bmatrix}$$

where $A_i(u)$ and $B_j(v)$ can be arbitrary functions (good choices Bernstein polynomials or B-Spline basis functions). Suppose that we have samples

$$\mathbf{y}_s = \mathbf{y}(u_s, v_s) \text{ for } s = 0, \dots, N_s$$

We want to find an approximating polynomial P.

41

2D Interpolation: Finding the best fit

Given a set of sample values $\mathbf{y}_s(u_s, v_s)$ corresponding to 2D coordinates (u_s, v_s) , left hand side basis functions $[A_0(u), \dots, A_m(u)]$ and right hand side basis functions $[B_0(v), \dots, B_n(v)]$, the goal is to find the matrix \mathbf{C} of coefficients c_{ij} .

To do this, solve the least squares problem

$$\begin{bmatrix} \vdots \\ \mathbf{y}_s(u_s, v_s) \\ \vdots \end{bmatrix} \approx \begin{bmatrix} \vdots & \vdots & \vdots & \vdots & \vdots \\ A_0(u_s)B_0(v_s) & A_0(u_s)B_1(v_s) & \dots & A_1(u_s)B_j(v_s) & \dots & A_m(u_s)B_n(v_s) \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \end{bmatrix} \bullet \begin{bmatrix} c_{00} \\ c_{01} \\ \vdots \\ c_{ij} \\ \vdots \\ c_{mn} \end{bmatrix}$$

42

2D Interpolation: Sampling on a regular grid

A common special case arises when the (u_s, v_s) form a regular grid. In this case we have $u_s \in \{u_0, \dots, u_{N_u}\}$ and $v_s \in \{v_0, \dots, v_{N_v}\}$. For each value $v_j \in \{v_0, \dots, v_{N_v}\}$ solve the N_s row least squares problem

$$\begin{bmatrix} \vdots \\ \mathbf{y}_s(u_s, v_j) \\ \vdots \end{bmatrix} \approx \begin{bmatrix} \vdots & \dots & \vdots \\ A_0(u_s) & \dots & A_m(u_s) \\ \vdots & \dots & \vdots \end{bmatrix} \cdot \begin{bmatrix} \mathbf{X}_{j0} \\ \vdots \\ \mathbf{X}_{jm} \end{bmatrix}$$

for the unknown m-vector \mathbf{X}_j . Then solve m n-variable least squares problems

$$\begin{bmatrix} \mathbf{X}_{00} & \mathbf{X}_{01} & \dots & \mathbf{X}_{0m} \\ \mathbf{X}_{10} & \mathbf{X}_{11} & \dots & \mathbf{X}_{1m} \\ \vdots & \vdots & \ddots & \vdots \\ \vdots & \vdots & \ddots & \vdots \\ \mathbf{X}_{N_v,0} & \mathbf{X}_{N_v,1} & \dots & \mathbf{X}_{N_v,m} \end{bmatrix} \approx \begin{bmatrix} B_0(v_0) & B_1(v_0) & \dots & B_n(v_0) \\ B_0(v_1) & B_1(v_1) & \dots & B_n(v_1) \\ \vdots & \vdots & \ddots & \vdots \\ \vdots & \vdots & \ddots & \vdots \\ B_0(v_{N_v}) & B_1(v_{N_v}) & \dots & B_n(v_{N_v}) \end{bmatrix} \cdot \begin{bmatrix} \mathbf{c}_{00} & \mathbf{c}_{10} & \dots & \mathbf{c}_{m0} \\ \mathbf{c}_{01} & \mathbf{c}_{11} & \dots & \mathbf{c}_{m1} \\ \vdots & \vdots & \ddots & \vdots \\ \mathbf{c}_{0n} & \mathbf{c}_{1n} & \dots & \mathbf{c}_{mn} \end{bmatrix}$$

for the vectors $[\mathbf{c}_{j0}, \dots, \mathbf{c}_{jn}]$. Note that this latter step requires only 1 SVD or similar matrix computation.

2D Interpolation: Sampling on a regular grid

- There are a number of caveats to the “grid” method on the previous slide. (E.g., you need enough data for each of the least squares problems). But where applicable the method can save computation time since it replaces a number of m and n variable least squares problems for one big m x n problem
- Note that there is a similar trick that you can play by grouping all the common u_i elements together.
- Note that the \mathbf{y}' s and the \mathbf{c}' s do not have to be scalar numbers. They can be Vectors, Matrices, or other objects that have appropriate algebraic properties

N-dimensional interpolation

- The methods described earlier generalize naturally to N dimensions.

$$P(\bar{\mathbf{u}}) = P(u_1, \dots, u_N) = \sum_{i_1=0}^{m_1} \dots \sum_{i_N=0}^{m_N} c_{i_1 \dots i_N} A_{i_1}^1(u_1) \dots A_{i_N}^N(u_N)$$

where $A_i^K(u)$ can be arbitrary functions

(good choices are Bernstein polynomials or

B-Spline basis functions). Suppose that we have samples

$$\mathbf{y}_s = \mathbf{y}(\bar{\mathbf{u}}_s) \text{ for } s = 0, \dots, N_s$$

We want to find coefficients of $c_{i_1 \dots i_N}$ approximating polynomial P.

N-dimensional interpolation

Define

$$F_{i_1 \dots i_N}(\bar{\mathbf{u}}) = A_{i_1}^1(u_1) \dots A_{i_N}^N(u_N)$$

Then solve the least squares problem

$$\begin{bmatrix} F_{00\dots 0}(\bar{\mathbf{u}}_s) & \vdots & \dots & F_{m_1 \dots m_n}(\bar{\mathbf{u}}_s) \\ F_{10\dots 0}(\bar{\mathbf{u}}_s) & \vdots & \dots & \\ \vdots & \vdots & \dots & \\ F_{m_1 \dots m_n}(\bar{\mathbf{u}}_s) & \vdots & \dots & \end{bmatrix} \begin{bmatrix} c_{00\dots 0} \\ c_{10\dots 0} \\ \vdots \\ c_{m_1 \dots m_n} \end{bmatrix} \cong \begin{bmatrix} \vdots \\ \mathbf{y}_s \\ \vdots \end{bmatrix}$$

Example: 3D Calibration of Distortion

Suppose we want to compute a distortion correction function for a distorted 3D navigational sensor. Let

$\bar{\mathbf{p}}_i$ = known 3D "ground truth"

$\bar{\mathbf{q}}_i$ = Values returned by navigational sensor

Here we will construct a "tensor form" interpolation polynomial using 5th degree Bernstein polynomials

$$F_{ijk}(u_x, u_y, u_z) = B_{5,i}(u_x)B_{5,j}(u_y)B_{5,k}(u_z)$$

We need to do the following:

1. Bernstein polynomials are really designed to work well in the range $0 \leq u \leq 1$, so we need to determine a "bounding box" to scale our $\bar{\mathbf{q}}_i$ values. I.e., we pick upper and lower limits $\bar{\mathbf{q}}^{\min}$ and $\bar{\mathbf{q}}^{\max}$ and compute $\bar{\mathbf{u}}_s = \text{ScaleToBox}(\bar{\mathbf{q}}_s, \bar{\mathbf{q}}^{\min}, \bar{\mathbf{q}}^{\max})$ where

$$\text{ScaleToBox}(x, x^{\min}, x^{\max}) = \frac{x - x^{\min}}{x^{\max} - x^{\min}}$$

2. Now, we set up and solve the least squares problem:

Example: 3D Calibration of Distortion

$$\begin{bmatrix} \vdots \\ F_{000}(\bar{\mathbf{u}}_s) & \cdots & F_{555}(\bar{\mathbf{u}}_s) \\ \vdots \end{bmatrix} \begin{bmatrix} \mathbf{c}_{000}^x & \mathbf{c}_{000}^y & \mathbf{c}_{000}^z \\ \vdots & \vdots & \vdots \\ \mathbf{c}_{555}^x & \mathbf{c}_{555}^y & \mathbf{c}_{555}^z \end{bmatrix} \approx \begin{bmatrix} \vdots \\ p_s^x & p_s^y & p_s^z \\ \vdots \end{bmatrix}$$

Example: 3D Calibration of Distortion

The correction function will then look like this:

$$\begin{aligned} \bar{\mathbf{p}} &= \text{CorrectDistortion}(\bar{\mathbf{q}}) \\ \{ & \bar{\mathbf{u}} = \text{ScaleToBox}(\bar{\mathbf{q}}, \bar{\mathbf{q}}^{\min}, \bar{\mathbf{q}}^{\max}) \\ & \text{return } \sum_{i=0}^5 \sum_{j=0}^5 \sum_{k=0}^5 \bar{\mathbf{c}}_{i,j,k} B_{5,i}(u_x) B_{5,j}(u_y) B_{5,k}(u_z) \\ & \} \end{aligned}$$

Radial Basis Function Interpolation

$$\bar{\mathbf{f}}(\bar{\mathbf{x}}) = \sum_{k=1}^n \bar{\mathbf{f}}_k \varphi(\|\bar{\mathbf{x}} - \bar{\mathbf{x}}_k\|) \quad \text{where } \bar{\mathbf{x}} \in \mathbb{R}^d$$

Given a set of points $\{\dots \bar{\mathbf{x}}_k \dots\}$, solve this system to find the $\bar{\mathbf{f}}_k$:

$$\begin{bmatrix} 0 & \varphi(\|\bar{\mathbf{x}}_2 - \bar{\mathbf{x}}_1\|) & \dots & \varphi(\|\bar{\mathbf{x}}_n - \bar{\mathbf{x}}_1\|) \\ \varphi(\|\bar{\mathbf{x}}_1 - \bar{\mathbf{x}}_2\|) & 0 & \dots & \varphi(\|\bar{\mathbf{x}}_n - \bar{\mathbf{x}}_2\|) \\ \vdots & \vdots & \ddots & \vdots \\ \varphi(\|\bar{\mathbf{x}}_1 - \bar{\mathbf{x}}_n\|) & \varphi(\|\bar{\mathbf{x}}_2 - \bar{\mathbf{x}}_n\|) & \dots & 0 \end{bmatrix} \begin{bmatrix} \bar{\mathbf{f}}_1^T \\ \bar{\mathbf{f}}_2^T \\ \vdots \\ \bar{\mathbf{f}}_n^T \end{bmatrix} = \begin{bmatrix} \bar{\mathbf{x}}_1^T \\ \bar{\mathbf{x}}_2^T \\ \vdots \\ \bar{\mathbf{x}}_n^T \end{bmatrix}$$

Sometimes add linear combination of polynomials $\bar{\gamma}_j(\bar{\mathbf{x}})$ to the method

$$\bar{\mathbf{f}}(\bar{\mathbf{x}}) = \sum_{k=1}^n \bar{\mathbf{f}}_k \varphi(\|\bar{\mathbf{x}} - \bar{\mathbf{x}}_k\|) + \sum_{j=1}^m \bar{\mathbf{g}}_j \gamma_j(\bar{\mathbf{x}}) \quad \text{where } \sum_{k=1}^n \bar{\mathbf{g}}_k \gamma_k(\bar{\mathbf{x}}_k) = 0$$

Radial Basis Function Interpolation

$$\bar{f}(\bar{x}) = \sum_{k=1}^n \bar{f}_k \varphi(\|\bar{x} - \bar{x}_k\|) \quad \text{where } \bar{x} \in \mathbb{R}^d$$

Typical radial basis functions with global support^[1]

Radial Basis Function	$\phi(r)$	parameters	order
Gaussians	$e^{-(cr)^2}$	$c > 0$	0
Polyharmonic Splines	r^{2k-1}	$k \in \mathbb{N}$	$m = k$
	$r^{2k} \log(r)$	$k \in \mathbb{N}$	$m = k + 1$
Multiquadrics	$\sqrt{r^2 + c^2}$	$c > 0$	1
Inverse Multiquadrics	$\frac{1}{\sqrt{r^2 + c^2}}$	$c > 0$	0
Inverse Quadratics	$\frac{1}{r^2 + c^2}$	$c > 0$	0

[1] W. du Toit, *Radial Basis Function Interpolation*, MS Thesis, University of Stellenbosch, 2008

Example radial basis function with compact support

$$\varphi(r) = \begin{cases} e^{-\left(\frac{1}{1-(cr)^2}\right)} & \text{for } 0 \leq r < \frac{1}{c} \\ 0 & \text{otherwise} \end{cases}$$

Note: The choice of constants in design of RBFs is important

Radial Basis Function Interpolation

- As mentioned in the previous slide, the choice of specific RBF basis and associated parameters is important and is generally problem-specific. The design process typically involves an optimization problem of some sort, trading off accuracy, coverage, and computational efficiency.
