Minimizing Rigid Registration Errors

Typically, given a set of points $\{a_i\}$ in one coordinate system and another set of points $\{b_i\}$ in a second coordinate system Goal is to find $[\mathbf{R},\mathbf{p}]$ that minimizes

$$\eta = \sum_i \mathbf{e}_i \bullet \mathbf{e}_i$$

where

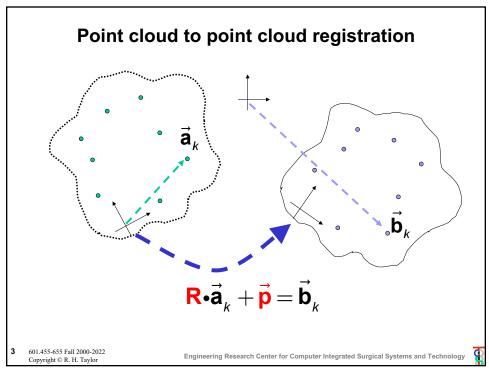

$$\mathbf{e}_i = (\mathbf{R} \cdot \mathbf{a}_i + \mathbf{p}) - \mathbf{b}_i$$

This is tricky, because of **R**.

601.455-655 Fall 2000-2022 Copyright © R. H. Taylor

Engineering Research Center for Computer Integrated Surgical Systems and Technology

<u>\$</u>

Minimizing Rigid Registration Errors

Step 1: Compute

$$\overline{\mathbf{a}} = \frac{1}{N} \sum_{i=1}^{N} \overline{\mathbf{a}}_{i}$$

$$\overline{\mathbf{b}} = \frac{1}{N} \sum_{i=1}^{N} \vec{\mathbf{b}}_{i}$$

$$\tilde{\mathbf{a}}_i = \vec{\mathbf{a}}_i - \overline{\mathbf{a}}$$

$$\tilde{\mathbf{b}}_i = \vec{\mathbf{b}}_i - \overline{\mathbf{b}}$$

Step 2: Find R that minimizes

$$\sum_{i} (\mathbf{R} \cdot \tilde{\mathbf{a}}_{i} - \tilde{\mathbf{b}}_{i})^{2}$$

Step 3: Find \vec{p}

$$\vec{p} = \overline{b} - R \cdot \overline{a}$$

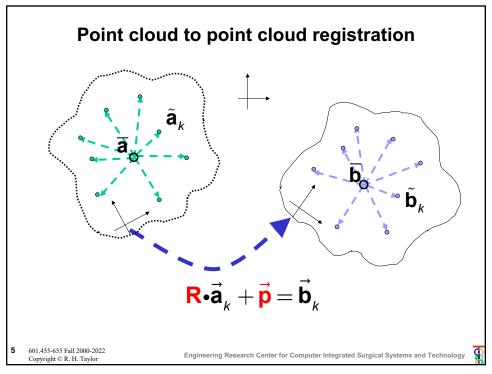

Step 4: Desired transformation is

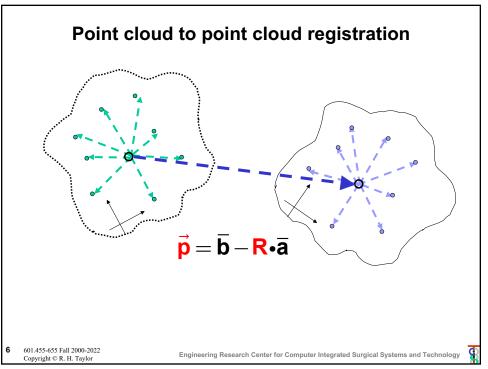

$$\mathbf{F} = Frame(\mathbf{R}, \vec{\mathbf{p}})$$

B

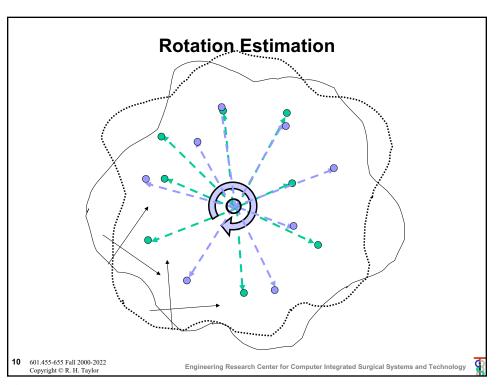

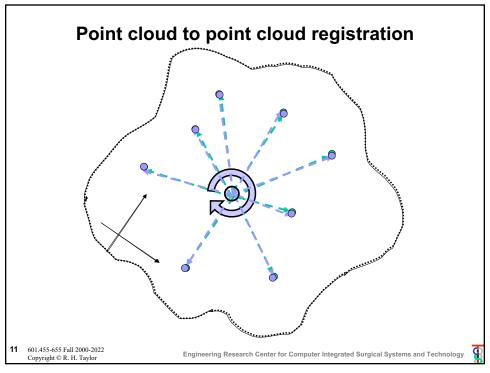

Solving for R: iteration method

Given $\left\{\cdots,\left(\tilde{\mathbf{a}}_{i},\tilde{\mathbf{b}}_{i}\right),\cdots\right\}$, want to find $\mathbf{R}=\arg\min\sum_{i}\left\|\mathbf{R}\tilde{\mathbf{a}}_{i}-\tilde{\mathbf{b}}_{i}\right\|^{2}$

Step 0: Make an initial guess \mathbf{R}_0

Step 1: Given \mathbf{R}_k , compute $\mathbf{b}_i = \mathbf{R}_k^{-1} \mathbf{\tilde{b}}_i$

Step 2: Compute ΔR that minimizes

$$\sum_{i} (\Delta \mathbf{R} \ \tilde{\mathbf{a}}_{i} - \breve{\mathbf{b}}_{i})^{2}$$

Step 3: Set $\mathbf{R}_{k+1} = \mathbf{R}_k \Delta \mathbf{R}$

Step 4: Iterate Steps 1-3 until residual error is sufficiently small (or other termination condition)

2 601.455-655 Fall 2000-2022 Copyright © R. H. Taylor

Engineering Research Center for Computer Integrated Surgical Systems and Technology

Iterative method: Getting Initial Guess

We want to find an approximate solution \mathbf{R}_0 to

$$\mathbf{R}_0 \bullet \left[\cdots \tilde{\mathbf{a}}_i \cdots \right] \approx \left[\cdots \tilde{\mathbf{b}}_i \cdots \right]$$

One way to do this is as follows. Form matrices

$$\mathbf{A} = \begin{bmatrix} \cdots \tilde{\mathbf{a}}_i \cdots \end{bmatrix} \quad \mathbf{B} = \begin{bmatrix} \cdots \tilde{\mathbf{b}}_i \cdots \end{bmatrix}$$

Solve least-squares problem $\mathbf{M}_{3x3}\mathbf{A}_{3xN} \approx \mathbf{B}_{3xN}$

Note: You may find it easier to solve $\mathbf{A}_{3xN}^T \mathbf{M}_{3x3}^T \approx \mathbf{B}_{3xN}^T$

Set $\mathbf{R}_0 = orthogonalize(\mathbf{M}_{3\times3})$. Verify that \mathbf{R} is a rotation

Our problem is now to solve $\mathbf{R}_0 \Delta \mathbf{R} \mathbf{A} \approx \mathbf{B}$. I.e., $\Delta \mathbf{R} \mathbf{A} \approx \mathbf{R}_0^{-1} \mathbf{B}$

Engineering Research Center for Computer Integrated Surgical Systems and Technology

g

13

Iterative method: Solving for ΔR

Approximate $\Delta \mathbf{R}$ as $(\mathbf{I} + skew(\overline{\alpha}))$. I.e.,

$$\Delta \mathbf{R} \bullet \mathbf{v} \approx \mathbf{v} + \overline{\alpha} \times \mathbf{v}$$

for any vector v. Then, our least squares problem becomes

$$\min_{\Delta \mathbf{R}} \sum_{i} (\Delta \mathbf{R} \bullet \tilde{\mathbf{a}}_{i} - \tilde{\mathbf{b}}_{i})^{2} \approx \min_{\overline{\alpha}} \sum_{i} (\tilde{\mathbf{a}}_{i} - \tilde{\mathbf{b}}_{i} + \overline{\alpha} \times \tilde{\mathbf{a}}_{i})^{2}$$

This is linear least squares problem in $\bar{\alpha}$.

Then compute $\Delta \mathbf{R}(\overline{\alpha})$

Note: Use trigonometric formulas to compute this

Engineering Research Center for Computer Integrated Surgical Systems and Technology

Direct Iterative approach for Rigid Frame

Given
$$\left\{\cdots,\left(\vec{\mathbf{a}}_{i},\vec{\mathbf{b}}_{i}\right),\cdots\right\}$$
, want to find $\mathbf{F}=\arg\min\sum_{i}\left\|\mathbf{F}\vec{\mathbf{a}}-\vec{\mathbf{b}}\right\|^{2}$

Step 0: Make an initial guess F₀

Step 1: Given \mathbf{F}_k , compute $\vec{\mathbf{a}}_i^k = \mathbf{F}_k \vec{\mathbf{a}}_i$

Step 2: Compute ΔF that minimizes

$$\sum_{i} \left\| \Delta \mathbf{F} \vec{\mathbf{a}}_{i}^{k} - \vec{\mathbf{b}}_{i} \right\|^{2}$$

Step 3: Set $\mathbf{F}_{k+1} = \Delta \mathbf{F} \mathbf{F}_{k}$

Step 4: Iterate Steps 1-3 until residual error is sufficiently small (or other termination condition)

15

Direct Iterative approach for Rigid Frame

To solve for
$$\Delta \mathbf{F} = \arg\min\sum_i \left\| \Delta \mathbf{F} \vec{\mathbf{a}}_i^k - \vec{\mathbf{b}}_i \right\|^2$$

$$\Delta \mathbf{F} \vec{\mathbf{a}}_{i}^{k} - \vec{\mathbf{b}}_{i} \approx \vec{\alpha} \times \vec{\mathbf{a}}_{i}^{k} + \vec{\varepsilon} + \vec{\mathbf{a}}_{i}^{k} - \vec{\mathbf{b}}_{i}$$

$$\vec{\alpha} \times \vec{\mathbf{a}}_{i}^{k} + \vec{\varepsilon} \approx \vec{\mathbf{b}}_{i} - \vec{\mathbf{a}}_{i}^{k}$$

$$sk(-\vec{\mathbf{a}}_{i}^{k})\vec{\alpha} + \vec{\varepsilon} \approx \vec{\mathbf{b}}_{i} - \vec{\mathbf{a}}_{i}^{k}$$

Solve the least-squares problem

$$\left[\begin{array}{ccc} \vdots & \vdots \\ sk(-\vec{\mathbf{a}}_{i}^{k}) & \mathbf{I} \\ \vdots & \vdots \end{array} \right] \left[\begin{array}{c} \vec{\alpha} \\ \vec{\varepsilon} \\ \end{array} \right] \approx \left[\begin{array}{c} \vdots \\ \vec{\mathbf{b}}_{i} - \vec{\mathbf{a}}_{i}^{k} \\ \vdots \\ \vdots \end{array} \right]$$

Now set $\Delta \mathbf{F} = [\Delta \mathbf{R}(\vec{\alpha}), \vec{\varepsilon}]$

Engineering Research Center for Computer Integrated Surgical Systems and Technology

Digression: quaternions

Invented by Hamilton in 1843. Can be thought of as

4 elements:
$$\mathbf{q} = \left[q_0, q_1, q_2, q_3 \right]$$

scalar & vector:
$$\mathbf{q} = s + \vec{\mathbf{v}} = \begin{bmatrix} s, \vec{\mathbf{v}} \end{bmatrix}$$

Complex number:
$$\mathbf{q} = q_0 + q_1 i + q_2 j + q_3 k$$

where
$$i^2 = j^2 = k^2 = i j k = -1$$

Properties:

Linearity:
$$\lambda \mathbf{q}_1 + \mu \mathbf{\vec{q}}_2 = \left[\lambda s_1 + \mu s_2, \lambda \mathbf{\vec{v}}_1 + \mu \mathbf{\vec{v}}_2 \right]$$

Conjugate:
$$\mathbf{q}^* = s - \vec{\mathbf{v}} = \begin{bmatrix} s, -\vec{\mathbf{v}} \end{bmatrix}$$

Product:
$$\mathbf{q}_1 \circ \mathbf{q}_2 = \begin{bmatrix} s_1 s_2 - \vec{\mathbf{v}}_1 \cdot \vec{\mathbf{v}}_2, s_1 \vec{\mathbf{v}}_2 + s_2 \vec{\mathbf{v}}_1 + \vec{\mathbf{v}}_1 \times \vec{\mathbf{v}}_2 \end{bmatrix}$$

Transform vector:
$$\mathbf{q} \circ \vec{\mathbf{p}} = \mathbf{q} \circ [0, \vec{\mathbf{p}}] \circ \mathbf{q}^*$$

Norm:
$$\|\mathbf{q}\| = \sqrt{s^2 + \vec{\mathbf{v}} \cdot \vec{\mathbf{v}}} = \sqrt{{q_0}^2 + {q_1}^2 + {q_2}^2 + {q_3}^2}$$

19

Digression continued: unit quaternions

We can associate a rotation by angle θ about an axis \vec{n} with the unit quaternion:

$$Rot(\vec{\mathbf{n}}, \theta) \Leftrightarrow \left[\cos\frac{\theta}{2}, \sin\frac{\theta}{2}\vec{\mathbf{n}}\right]$$

Exercise: Demonstrate this relationship. I.e., show

$$Rot((\vec{\mathbf{n}}, \theta) \cdot \vec{\mathbf{p}} = \left[\cos\frac{\theta}{2}, \sin\frac{\theta}{2}\vec{\mathbf{n}}\right] \circ \left[0, \vec{\mathbf{p}}\right] \circ \left[\cos\frac{\theta}{2}, -\sin\frac{\theta}{2}\vec{\mathbf{n}}\right]$$

Hint: Substitute and reduce to see if you get Rodrigues' formula.

Engineering Research Center for Computer Integrated Surgical Systems and Technology

Quaternion method for R

Step 1: Compute

$$\mathbf{H} = \sum_{i} \left[\begin{array}{ccc} \tilde{a}_{i,x} \tilde{b}_{i,x} & \tilde{a}_{i,x} \tilde{b}_{i,y} & \tilde{a}_{i,x} \tilde{b}_{i,z} \\ \tilde{a}_{i,y} \tilde{b}_{i,x} & \tilde{a}_{i,y} \tilde{b}_{i,y} & \tilde{a}_{i,y} \tilde{b}_{i,z} \\ \tilde{a}_{i,z} \tilde{b}_{i,x} & \tilde{a}_{i,z} \tilde{b}_{i,y} & \tilde{a}_{i,z} \tilde{b}_{i,z} \end{array} \right]$$

Step 2: Compute

$$\mathbf{G} = \begin{bmatrix} trace(\mathbf{H}) & \Delta^T \\ \Delta & \mathbf{H} + \mathbf{H}^T - trace(\mathbf{H})\mathbf{I} \end{bmatrix}$$

where
$$\Delta^T = \begin{bmatrix} \mathbf{H}_{2,3} - \mathbf{H}_{3,2} & \mathbf{H}_{3,1} - \mathbf{H}_{1,3} & \mathbf{H}_{1,2} - \mathbf{H}_{2,1} \end{bmatrix}$$

Step 3: Compute eigen value decomposition of G

$$diag(\overline{\lambda})=Q^TGQ$$

Step 4: The eigenvector $\mathbf{Q}_k = \left[q_0, q_1, q_2, q_3\right]$ corresponding to the largest eigenvalue λ_k is a unit quaternion corresponding to the rotation.

g

25

Another Quaternion Method for R

Let ${\bf q} \, = s + \vec{\bf v}$ be the unit quaternion corresponding

to **R**. Let $\tilde{\mathbf{a}}$ and $\tilde{\mathbf{b}}$ be vectors with $\tilde{\mathbf{b}} = \mathbf{R} \cdot \tilde{\mathbf{a}}$ then we have the quaternion equation

$$(s+\vec{\mathbf{v}}) \cdot (0+\tilde{\mathbf{a}})(s-\vec{\mathbf{v}}) = 0+\tilde{\mathbf{b}}$$

$$(s+\vec{\mathbf{v}}) \cdot (0+\tilde{\mathbf{a}}) = (0+\tilde{\mathbf{b}}) \cdot (s+\vec{\mathbf{v}}) \quad \text{since } (s-\vec{\mathbf{v}})(s+\vec{\mathbf{v}}) = 1+\vec{\mathbf{0}}$$

Expanding the scalar and vector parts gives

$$-\vec{\mathbf{v}} \cdot \tilde{\mathbf{a}} = -\vec{\mathbf{v}} \cdot \tilde{\mathbf{b}}$$
$$s\vec{\mathbf{a}} + \vec{\mathbf{v}} \times \tilde{\mathbf{a}} = s\tilde{\mathbf{b}} + \tilde{\mathbf{b}} \times \vec{\mathbf{v}}$$

Rearranging ...

$$\begin{split} &(\tilde{\boldsymbol{b}}-\tilde{\boldsymbol{a}})\boldsymbol{\cdot}\vec{\boldsymbol{v}}=0\\ &s(\tilde{\boldsymbol{b}}-\tilde{\boldsymbol{a}})+(\tilde{\boldsymbol{b}}+\tilde{\boldsymbol{a}})\times\vec{\boldsymbol{v}}=\vec{\boldsymbol{0}}_{_{3}} \end{split}$$

NOTE: This method works for any set of vectors \vec{a} and \vec{b} . We are using the symbols \tilde{a} and \tilde{b} to maintain consistency with the discussion of the previous method.

26 601.455-655 Fall 2000-2022 Copyright © R. H. Taylor

Engineering Research Center for Computer Integrated Surgical Systems and Technology

<u>\$</u>

Another Quaternion Method for R

Expressing this as a matrix equation

$$\left[\begin{array}{c|c}
0 & \left(\tilde{\mathbf{b}} - \tilde{\mathbf{a}}\right)^{\mathsf{T}} \\
\hline \left(\tilde{\mathbf{b}} - \tilde{\mathbf{a}}\right) & sk\left(\tilde{\mathbf{b}} + \tilde{\mathbf{a}}\right)
\end{array}\right] \left[\begin{array}{c}
s \\
\hline \vec{\mathbf{v}}
\end{array}\right] = \left[\begin{array}{c}
0 \\
\hline \vec{\mathbf{0}}_{3}
\end{array}\right]$$

If we now express the quaternion \mathbf{q} as a 4-vector $\vec{\mathbf{q}} = \begin{bmatrix} s, \vec{\mathbf{v}} \end{bmatrix}^T$, we can express the rotation problem as the constrained linear system

$$\mathbf{M}(\vec{\mathbf{a}}, \vec{\mathbf{b}})\vec{\mathbf{q}} = \vec{\mathbf{0}}_{4}$$
$$\left| \left| \vec{\mathbf{q}} \right| \right| = 1$$

27 601.455-655 Fall 2000-2022 Copyright © R. H. Taylor

Engineering Research Center for Computer Integrated Surgical Systems and Technology

g

27

Another Quaternion Method for R

In general, we have many observations, and we want to solve the problem in a least squares sense:

min
$$\|\mathbf{M}\mathbf{q}\|$$
 subject to $\|\mathbf{q}\| = 1$

where

$$\mathbf{M} = \begin{bmatrix} \mathbf{M}(\vec{\mathbf{a}}_1, \vec{\mathbf{b}}_1) \\ \vdots \\ \mathbf{M}(\vec{\mathbf{a}}_n, \vec{\mathbf{b}}_n) \end{bmatrix} \text{ and } n \text{ is the number of observations}$$

Taking the singular value decomposition of $\mathbf{M} = \mathbf{U} \Sigma \mathbf{V}^T$ reduces this to the easier problem

$$\text{min } \left\| \boldsymbol{U} \boldsymbol{\Sigma} \boldsymbol{V}^{\mathsf{T}} \vec{\boldsymbol{q}}_{\boldsymbol{\chi}} \right\| = \left\| \boldsymbol{U} \left(\boldsymbol{\Sigma} \vec{\boldsymbol{y}} \right) \right\| = \left\| \boldsymbol{\Sigma} \vec{\boldsymbol{y}} \right\| \text{ subject to } \left\| \vec{\boldsymbol{y}} \right\| = \left\| \boldsymbol{V}^{\mathsf{T}} \vec{\boldsymbol{q}} \right\| = \left\| \vec{\boldsymbol{q}} \right\| \ = 1$$

8 601.455-655 Fall 2000-2022 Copyright © R. H. Taylor

Engineering Research Center for Computer Integrated Surgical Systems and Technology

Another Quaternion Method for R

This problem is just

$$\min \|\Sigma \vec{\mathbf{y}}\| = \begin{bmatrix} \sigma_1 & 0 & 0 & 0 \\ 0 & \sigma_2 & 0 & 0 \\ 0 & 0 & \sigma_3 & 0 \\ 0 & 0 & 0 & \sigma_4 \end{bmatrix} \vec{\mathbf{y}} \quad \text{subject to } \|\vec{\mathbf{y}}\| = 1$$

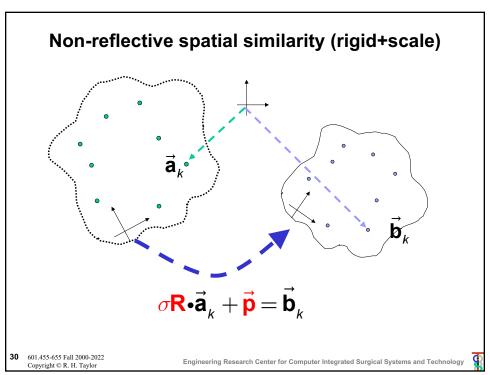

where σ_i are the singular values. Recall that SVD routines typically return the $\sigma_i \geq 0$ and sorted in decreasing magnitude. So σ_4 is the smallest singular value and the value of $\vec{\mathbf{y}}$ with $\|\vec{\mathbf{y}}\| = 1$ that minimizes $\|\Sigma\vec{\mathbf{y}}\|$ is $\vec{\mathbf{y}} = \begin{bmatrix} 0,0,0,1 \end{bmatrix}^T$. The corresponding value of $\vec{\mathbf{q}}$ is given by $\vec{\mathbf{q}} = \mathbf{V}\vec{\mathbf{y}} = \mathbf{V}_4$. Where \mathbf{V}_4 is the 4th column of \mathbf{V} .

29

Non-reflective spatial similarity

Step 1: Compute

$$\overline{\mathbf{a}} = \frac{1}{N} \sum_{i=1}^{N} \overline{\mathbf{a}}_{i}$$

$$\overline{\mathbf{b}} = \frac{1}{N} \sum_{i=1}^{N} \overline{\mathbf{b}}$$

$$\tilde{\mathbf{a}}_i = \vec{\mathbf{a}}_i - \overline{\mathbf{a}}$$

$$\tilde{\mathbf{b}}_i = \vec{\mathbf{b}}_i - \overline{\mathbf{b}}$$

Step 2: Estimate scale

$$\sigma = \frac{\sum_{i} \|\tilde{\mathbf{b}}_{i}\|}{\sum_{i} \|\tilde{\mathbf{a}}_{i}\|}$$

Step 3: Find R that minimizes

$$\sum_{i} (\mathbf{R} \cdot \left(\sigma \tilde{\mathbf{a}}_{i} \right) - \tilde{\mathbf{b}}_{i})^{2}$$

Step 4: Find \vec{p}

$$\vec{p} = \ \overline{b} - R \cdot \overline{a}$$

Step 5: Desired transformation is

 $\mathbf{F} = SimilarityFrame(\mathbf{\sigma}, \mathbf{R}, \vec{\mathbf{p}})$

Probabilistic Estimation

Recall that $\mathbf{v}_k + \vec{\varepsilon}_k = \Delta \mathbf{F}(\vec{\eta}_F) \mathbf{F} \vec{\mathbf{b}}_k$, so that

$$\vec{\varepsilon}_k = \vec{\alpha}_k \times \vec{\mathbf{F}}\vec{\mathbf{b}}_k + \vec{\varepsilon}_k = \mathbf{A}_k \vec{\eta}_k$$
, where $\mathbf{A}_k = \begin{bmatrix} -sk(\vec{\mathbf{F}}\vec{\mathbf{b}}_k) & \mathbf{I} \end{bmatrix}$

If we assume that the $\vec{\epsilon}_{_{k}}$ are independent, then

$$pr(E=[\vec{\varepsilon}_1,\dots,\vec{\varepsilon}_m] \mid \vec{\eta}_F) = \prod_{k} pr(\vec{\varepsilon}_k \mid \vec{\eta}_F) = \prod_{k} \frac{\exp(-\vec{\eta}_F^T \mathbf{G}_k^{-1} \vec{\eta}_F / 2)}{\sqrt{(2\pi)^n |\mathbf{G}_k|}}$$

where
$$\mathbf{G}_k = \mathbf{A}_k^T \mathbf{C}_k \mathbf{A}_k$$
 and $\mathbf{A}_k = \begin{bmatrix} -sk(\mathbf{F}\ddot{\mathbf{b}}_k) & \mathbf{I} \end{bmatrix}$

$$L(\mathbf{E} \mid \vec{\eta}_{E}) = \log(pr(\mathbf{E} \mid \vec{\eta}_{E})] = -\sum_{k} \vec{\eta}_{E}^{\mathsf{T}} \mathbf{G}_{k}^{-1} \vec{\eta}_{E} / 2 - \text{constant}$$

Find the value $\vec{\eta}_{E}^{\#}$ that produces most likely value $\mathbf{E}^{\#}$ for $\mathbf{E} \mid (\vec{\eta}_{E} = \vec{\eta}_{E}^{\#})$

$$\vec{\eta}_{\scriptscriptstyle F}^{\#} = \underset{\vec{\eta}_{\scriptscriptstyle F}}{\operatorname{argmax}} \Big(- \sum_{\scriptscriptstyle k} \vec{\eta}_{\scriptscriptstyle F}^{\scriptscriptstyle T} \mathbf{G}_{\scriptscriptstyle k}^{\scriptscriptstyle -1} \vec{\eta}_{\scriptscriptstyle F} \Big) = \underset{\vec{\eta}_{\scriptscriptstyle F}}{\operatorname{argmin}} \sum_{\scriptscriptstyle k} \vec{\eta}_{\scriptscriptstyle F}^{\scriptscriptstyle T} \mathbf{G}_{\scriptscriptstyle k}^{\scriptscriptstyle -1} \vec{\eta}_{\scriptscriptstyle F} = \underset{\vec{\eta}_{\scriptscriptstyle F}}{\operatorname{argmin}} \ \vec{\eta}_{\scriptscriptstyle F}^{\scriptscriptstyle T} \Big(\sum_{\scriptscriptstyle k} \mathbf{G}_{\scriptscriptstyle k}^{\scriptscriptstyle -1} \Big) \vec{\eta}_{\scriptscriptstyle F}$$

Probabilistic Estimation

Continuing from $\vec{\eta}_F^\# = \underset{\vec{\eta}_F}{\operatorname{argmin}} \ \vec{\eta}_F^T \Big(\sum_k \mathbf{G}_k^{-1} \Big) \vec{\eta}_F$

We can use this value to produce a most likely value **F**[#] for **F**

$$\mathbf{F}^{\#} = \Delta \mathbf{F}(\vec{\eta}^{\#}) \mathbf{F} = [\mathbf{R}(\vec{\alpha}^{\#}), \vec{\varepsilon}^{\#}] \bullet [\mathbf{R}, \vec{\mathbf{p}}] = [\mathbf{R}(\vec{\alpha}^{\#}) \mathbf{R}, \mathbf{R}(\vec{\alpha}^{\#}) \vec{\mathbf{p}} + \vec{\varepsilon}^{\#}]$$

Remember that $\mathbf{R}(\vec{\alpha}^{\#}) \neq \mathbf{I} + sk(\vec{\alpha}^{\#})$

If we now update $\mathbf{F} \leftarrow \mathbf{F}^{\sharp}$, we want to know how confident we can be in this new estimated value. We can redefine $\vec{\eta}_{\scriptscriptstyle F}$ so that

$$\mathbf{F}^* = \Delta \mathbf{F}(\vec{\eta}_F) \mathbf{F}$$
 where $\vec{\eta}_F \sim \mathrm{N}(\vec{\mathbf{0}}, \mathbf{C}_F)$

$$\mathbf{C}_{_{\!F}} = \left(\sum\nolimits_{_{\!k}} \mathbf{G}_{_{\!k}}^{^{-1}}\right)^{^{-1}} = \mathbf{Q}_{_{\!F}} \Lambda_{_{\!F}}^2 \mathbf{Q}_{_{\!F}}^{^{T}} \quad \text{where } \Lambda_{_{\!F}}^2 \text{ is diagonal and } \mathbf{Q}_{_{\!F}} \mathbf{Q}_{_{\!F}}^{^{T}} = \mathbf{I}$$

$$pr(\vec{\eta}_{F}) = \frac{\exp(-\vec{\eta}_{F}^{T}\mathbf{C}_{F}^{-1}\vec{\eta}_{F}/2)}{\sqrt{(2\pi)^{n}|\mathbf{C}_{F}|}} = \frac{\exp(-\vec{\eta}_{F}^{T}\mathbf{C}_{F}^{-1}\vec{\eta}_{F}/2)}{\sqrt{(2\pi)^{n}|\Lambda_{F}^{2}|}}$$
