

# Project 8: UI for Radiation Therapy Cohort Selection

Members: Domonique Carbajal, Keefer Chern  
Mentors: Todd McNutt, Pranav Lakshminarayanan

# Background

There currently exists a SQL database which contains sizeable amounts of data of patients with various types of cancers undergoing radiation therapy.

There is a website developed in C# that is connected with this database

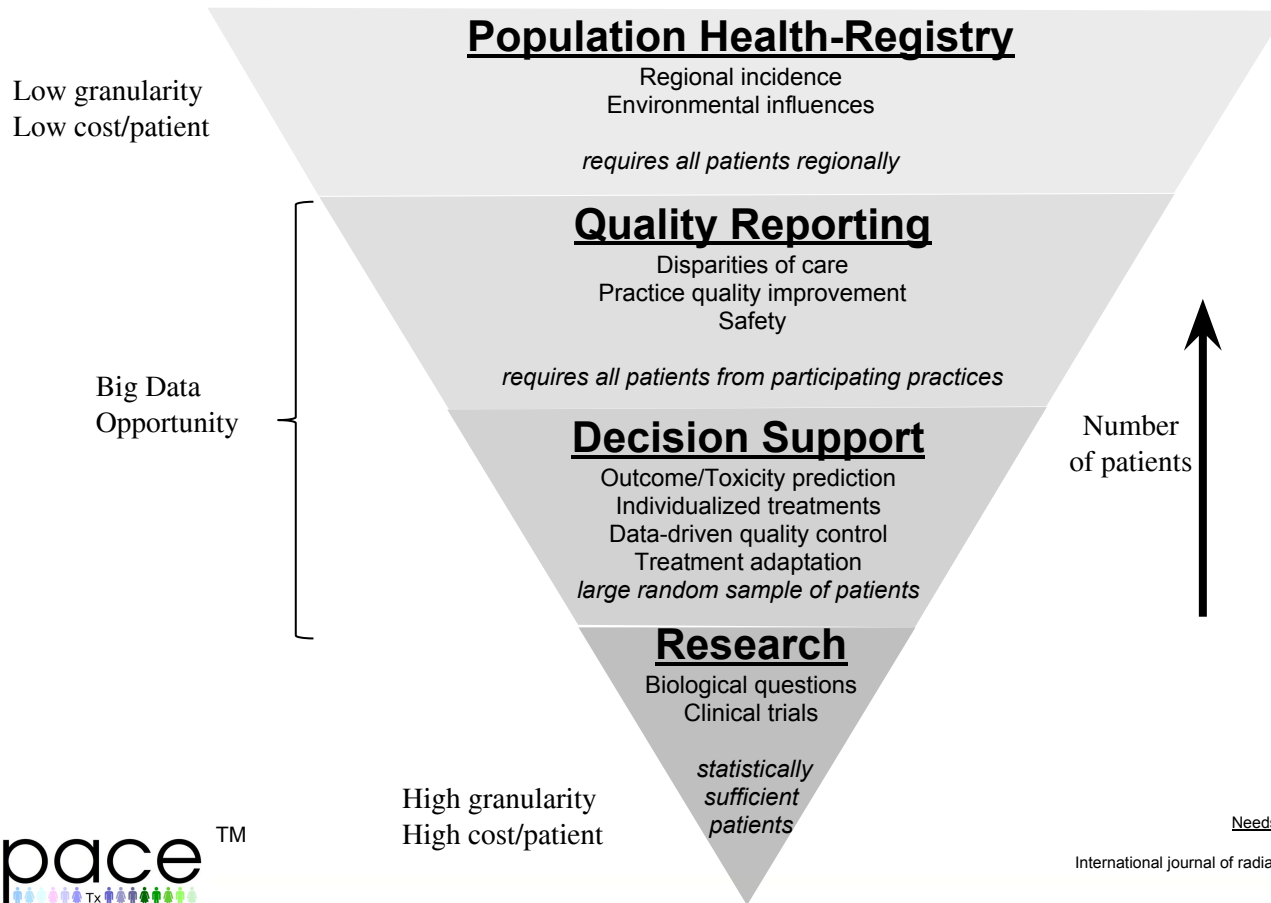

# Motivation

There is a desire for doctors and researchers to use this data for:

- Quality Reporting
- Decision Support
- Toxicity Prediction
- Research

# Levels of Big Data

# Problem

- Currently there is no quick and intuitive way to select patient cohorts from this database other than through a command prompt.
- There is also no visuals of the outcomes of patients selected by these variables.
- No way to save and load variable parameters.

**Retrieve patient data via free text SQL query**

```
SELECT * FROM Patients
WHERE (diagnosisICD9 = '146.9' OR diagnosisICD9 = '146.8' OR diagnosisICD9 = '146.7' OR diagnosisICD9 = '146.6') AND ageAtRefDate < '60'
ORDER BY diagnosisICD9
```

Run Query

**Query Result**

| patientID | clinicSite | protocolName | protocolID | firstContact | ageAtRefDate | attending | referredBy | referralReason | diagnosisICD9 |
|-----------|------------|--------------|------------|--------------|--------------|-----------|------------|----------------|---------------|
| 865       |            |              |            |              | 39           |           |            |                | 146.8         |
| 302       |            |              |            |              | 58           |           |            |                | 146.8         |
| 324       |            |              |            |              | 42           |           |            |                | 146.9         |
| 328       |            |              |            |              | 46           |           |            |                | 146.9         |
| 798       |            |              |            |              | 51           |           |            |                | 146.9         |
| 228       |            |              |            |              | 54           |           |            |                | 146.9         |
| 243       |            |              |            |              | 55           |           |            |                | 146.9         |

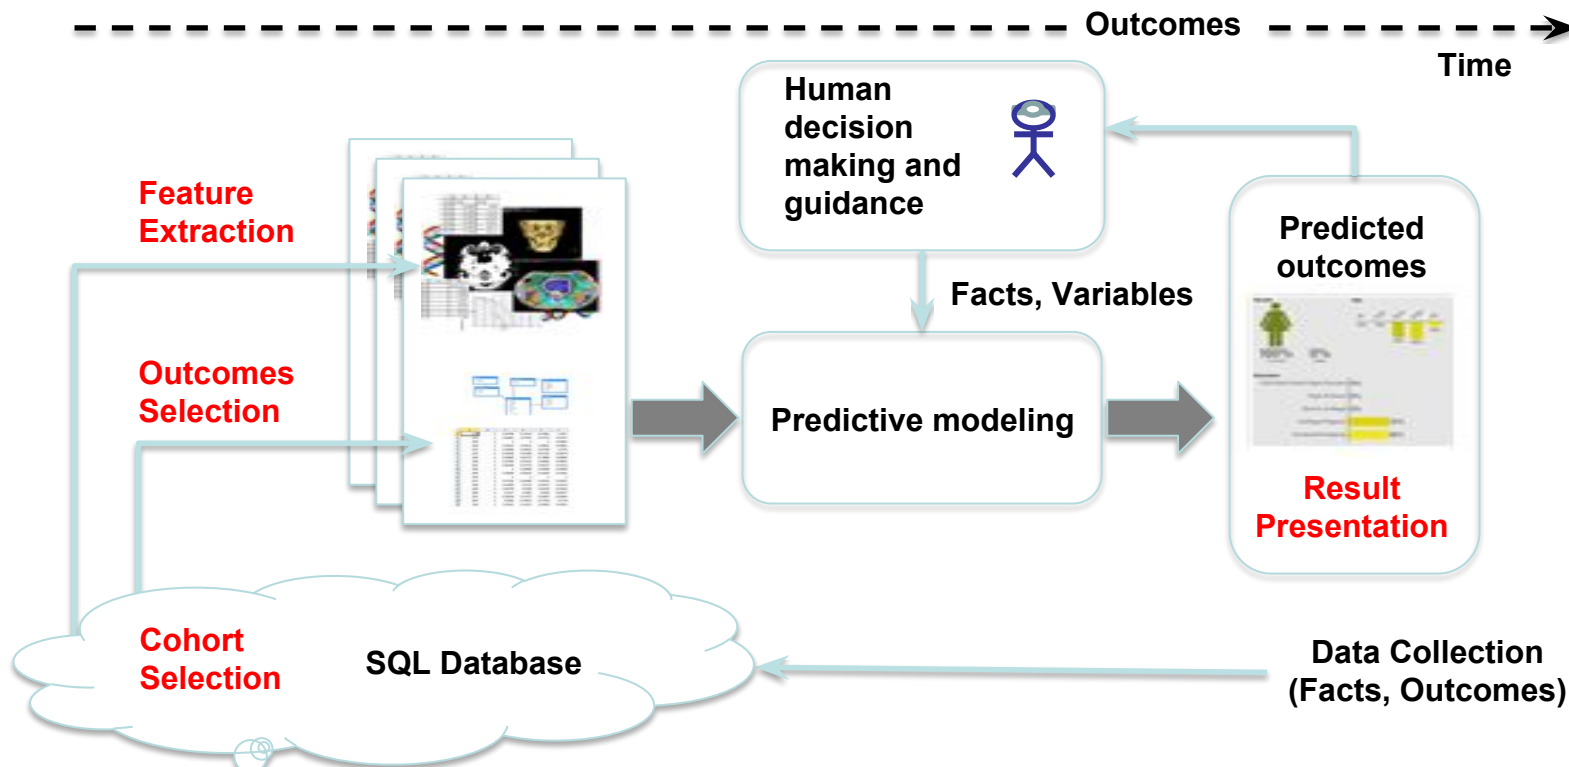

Export to Excel

# Goal

Develop a User Interface that would allow user the ability to:

- Select a patient cohort based upon any number of variables (SQL and Python)
- Perform statistical analysis on the extracted data (Python)
- Display the data in an easily comprehensible way (C# and JavaScript)
- Load and save parameters in a database query call (SQL)

# Learning health system

# Deliverables

**Minimum:** UI and algorithm allowing for static variable(age, race, gender, diagnosis) selection of cohort with code and documentation.

**Expected:** Longitudinal variable (duration/onset of symptoms) selection of cohort with code and documentation. Query saving and loading implementation.

**Maximum:** Derived variable selection(Dose Volume Histogram comparison) of cohorts with code and documentation.

# Milestones

| Milestone                                                           | Date      | Status     | Measurable                                                        |
|---------------------------------------------------------------------|-----------|------------|-------------------------------------------------------------------|
| Presentation And Proposal                                           | 2/14-2/28 | In Process | Complete presentation and email proposal                          |
| Familiarize self with code and database                             |           | In Process | Be capable of editing website and understanding existing code     |
| UI set up to allow for cohort selection with Static variables.      | 3/18      | To Do      | Perform a cohort selection, have report of code and documentation |
| UI set up to allow for cohort selection with Longitudinal variables | 4/19      | To Do      | Perform a cohort selection, have report of code and documentation |
| Query Load and Save Parameters                                      | 4/5       | To Do      | Successfully save query and load independently on site            |

# Timeline

|                                                                                          | Feb     |       |          | Mar |       |       |       | Apr |      |       |       |          | May |
|------------------------------------------------------------------------------------------|---------|-------|----------|-----|-------|-------|-------|-----|------|-------|-------|----------|-----|
|                                                                                          | 11 - 15 | 18-22 | 25-Mar 1 | 4-8 | 11-15 | 18-22 | 25-29 | 1-5 | 8-12 | 15-19 | 22-26 | 29-May 3 | 6-9 |
| Project Proposal                                                                         |         |       |          |     |       |       |       |     |      |       |       |          |     |
| Familiarize with C# usage and SQL database                                               |         |       |          |     |       |       |       |     |      |       |       |          |     |
| Develop front end display for all implementations (C#)                                   |         |       |          |     |       |       |       |     |      |       |       |          |     |
| Develop method/algorithm for cohort selection in the backend with Static variables.      |         |       |          |     |       |       |       |     |      |       |       |          |     |
| Connect developed method to the front end.                                               |         |       |          |     |       |       |       |     |      |       |       |          |     |
| Research and implement query saving/loading                                              |         |       |          |     |       |       |       |     |      |       |       |          |     |
| Develop method/algorithm for cohort selection in the backend with longitudinal variables |         |       |          |     |       |       |       |     |      |       |       |          |     |
| Connect developed method to the front end.                                               |         |       |          |     |       |       |       |     |      |       |       |          |     |
| Documentation and Testing                                                                |         |       |          |     |       |       |       |     |      |       |       |          |     |
| Final Presentation                                                                       |         |       |          |     |       |       |       |     |      |       |       |          |     |

# Dependencies

| Dependency                                            | Plan to Resolve                                    | Estimated Resolution Date | Resolved? |
|-------------------------------------------------------|----------------------------------------------------|---------------------------|-----------|
| Access to Database and Website                        | Talk to Dr. McNutt                                 | 2/12/19                   | Yes       |
| Access to Previous Code                               | Talk to Dr. McNutt/Pranav                          | 2/14/19                   | No        |
| Access to Clinicians or Researchers to Test Usability | Talk to Dr. McNutt or have Dr.McNutt as the Tester | 2/15/19                   | No        |

# Management Plan

| Keefer                                    | Domonique                                   |
|-------------------------------------------|---------------------------------------------|
| Frontend(C# and JavaScript)               | Backend(SQL, Python)                        |
| Parameter Management (Saving and Loading) | Data Manipulation                           |
| Developing the UI                         | Data Extraction                             |
| Data Visualization                        | Connection between C# and python            |
| Statistical analysis and output           | Communication between frontend and backend. |

# Coordination:

## Meetings:

- Weekly meetings with Dr. McNutt and Pranav on Fridays

- Extra meetings with Pranav by appointment.

- Team biweekly meetings on Monday and Wednesday

## Communication:

- Text Message(between team members)

- Hopkins Email

## Code Storage:

- Github with private repository

## Report/Documentation Storage:

- JHBox
