

## Interpretable video-based assessment of surgical skill through analytics of surgical field geometry

- Develop analytics to quantitatively describe geometry of the surgical field for automated video-based skill assessment
- **What Students Will Do:**
  - Use an existing annotated video dataset; annotate instrument tips in phacoemulsification step
  - Analyze images to segment limbus and instrument tips
  - Develop metrics to describe instrument motion relative to context (center of eye, capsulorhexis margin)
- **Deliverables:**
  - Minimum: Segment limbus, detect center of pupil, metrics to describe instrument motion relative to center of pupil
  - Optimal: Use metrics to predict binary skill class label
  - Maximum: Detect capsulorhexis margin + metrics relative to the margin
- **Size group:** 2 or 3
- **Skills:** Deep learning, computer vision, Python
- **Mentors:** Shameema Sikder & Swaroop Vedula
- contact info: swaroop@jhu.edu & ssikder1@jhmi.edu
